NEW QUESTION # 24

In ABAP SQL, which of the following retrieves the association field _Airline-Name of a CDS view?

- A. !_Airline-Name
- B. @_Airline-Name
- C. *_Airline Name
- D. /_Airline Name

Answer: B

Explanation:

Explanation

In ABAP SQL, the syntax to retrieve the association field of a CDS view is to use the @ sign followed by the association name and the field name, separated by a period sign (.). For example, to retrieve the association field _Airline-Name of a CDS view, the syntax is @_Airline-Name. This syntax allows the access to the fields of the target data source of the association without explicitly joining the data sources¹. The other options are incorrect because they use the wrong symbols or formats to access the association field.

In order to protect the vital interests of each IT certification exams candidate, Dumpcollection provides high-quality SAP C-ABAPD-2309 Exam Training materials. This exam material is specially developed according to the needs of the candidates. It is researched by the IT experts of Dumpcollection. Their struggle is not just to help you pass the exam, but also in order to let you have a better tomorrow.

SAP C-ABAPD-2309 Exam Syllabus Topics:

Topic	Details
Topic 1	ABAP RESTful Application Programming Model: This topic explains the ABAP Restful Application Programming model, ABAP development, and the architecture of the ABAP Restful Application Programming model.
Topic 2	Object-oriented design: It measures your knowledge about encapsulation, upcast, inheritance, polymorphism, and interfaces. Moreover, the topic evaluates your knowledge about constructor calls, Exception classes, and singleton pattern.

Topic 3	ABAP core data services and data modeling: It focuses on Core Data Services (CDS) views, SAP HANA database tables, foreign key relationships, and annotations.

New Release C-ABAPD-2309 Exam Dumps - SAP C-ABAPD-2309 Questions

Facing the incoming C-ABAPD-2309 exam, you may feel stained and anxious, suspicious whether you could pass the exam smoothly and successfully. Actually, you must not impoverish your ambition. Our suggestions are never boggle at difficulties. It is your right time to make your mark. Preparation of exam without effective materials is just like a soldier without gun. You will be feeling be counteracted the effect of tension for our C-ABAPD-2309 practice dumps can relieve you of the anxious feelings.

SAP Certified Associate - Back-End Developer - ABAP Cloud Sample Questions (Q72-Q77):

NEW QUESTION # 72

What are some properties of database tables? Note: There are 2 correct answers to this question.

- A. They can have relationships to other tables.
- B. They can have any number of key fields.
- C. They store information in two dimensions.
- D. They may have key fields.

Answer: A,C

Explanation:

Database tables are data structures that store information in two dimensions, using rows and columns. Each row represents a record or an entity, and each column represents an attribute or a field. Database tables may have key fields, which are columns that uniquely identify each row or a subset of rows. Key fields can be used to enforce data integrity, perform efficient searches, and establish relationships to other tables. Database tables can have relationships to other tables, which are associations or links between the key fields of two or more tables. Relationships can be used to model the logical connections between different entities, join data from multiple tables, and enforce referential integrity12.

NEW QUESTION # 73

Given the following Core Data Services View Entity Data Definition:

```

1 @AccessControl.authorizationCheck: #NOT_REQUIRED
2 DEFINE VIEW ENTITY demo_cds_assoc_element
3   AS SELECT FROM scarr
4   ASSOCIATION OF ONE TO MANY demo_cds_assoc_spfli AS _spfli
5   ON scarr.carriid = _spfli.carriid
6   {
7     KEY carriid,
8   ?
9     carrname
10  }
```

The "demo_ods_assoc_spfli" data source referenced in line #4 contains a field "connid" which you would like to expose in the element list.

Which of the following statements would do this if inserted on line #8?

- A. demo_ods_assoc_spfli-connid/
- B. _spfli.connid/
- C. spfli-connid,
- D. demo_ods_assoc_spfli.connid,

Answer: D

Explanation:

Explanation

The statement that can be used to expose the field "connid" of the data source "demo_ods_assoc_spfli" in the element list is A. demo_ods_assoc_spfli.connid. This statement uses the dot notation to access the field

"connid" of the data source "demo_ods_assoc_spfli", which is an association defined on line #4. The association

"demo_ods_assoc_spfli" links the data source "demo_ods" with the table "spfli" using the field

"carid". The statement also ends with a comma to separate it from the next element in the list12.

You cannot do any of the following:

B: demo_ods_assoc_spfli-connid/: This statement uses the wrong syntax to access the field "connid" of the data source "demo_ods_assoc_spfli". The dash notation is used to access the components of a structure or a table, not the fields of a data source. The statement also ends with a slash, which is not a valid separator for the element list12.

C: spfli-connid,: This statement uses the wrong data source name to access the field "connid". The data source name should be "demo_ods_assoc_spfli", not "spfli". The statement also uses the wrong syntax to access the field "connid", as explained above12.

D: _spfli.connid/: This statement uses the wrong data source name and the wrong separator to access the field "connid". The data source name should be "demo_ods_assoc_spfli", not "_spfli". The statement also ends with a slash, which is not a valid separator for the element list12.

NEW QUESTION # 74

/DMO/I_Connection is a CDS view.

What variable type is connection full based on the following code? DATA connection full TYPE

/DMD/I_Connection.

- A. Structure
- B. Simple variable
- C. Internal Table

Answer: A

NEW QUESTION # 75

For what kind of applications would you consider using on-stack developer extensions? Note: There are 2 correct answers to this question.

- A. Applications that integrate data from several different systems
- B. Applications that access SAP S/4HANA data using complex SQL
- C. Applications that run separate from SAP S/4HANA
- D. Applications that provide APIs for side by side SAP BTP apps

Answer: B,D

Explanation:

On-stack developer extensibility is a type of extensibility that allows you to create development projects directly on the SAP S/4HANA Cloud technology stack. It gives you the opportunity to develop cloud-ready and upgrade-stable custom ABAP applications and services inside the SAP S/4HANA Cloud, public edition system. You can use the ABAP Development Tools in Eclipse to create and deploy your on-stack extensions.

On-stack developer extensibility is suitable for the following kinds of applications:

* Applications that provide APIs for side by side SAP BTP apps. On-stack developer extensibility allows you to create OData services or RESTful APIs based on CDS view entities or projection views. These services or APIs can expose SAP S/4HANA data and logic to other applications that run on the SAP Business Technology Platform (SAP BTP) or other platforms. This way, you can create a loosely coupled integration between your SAP S/4HANA system and your side by side SAP BTP apps.

* Applications that access SAP S/4HANA data using complex SQL. On-stack developer extensibility allows you to use ABAP SQL to access SAP S/4HANA data using complex queries, such as joins, aggregations, filters, parameters, and code pushdown techniques. You can also use ABAP SQL to perform data manipulation operations, such as insert, update, delete, and upsert. This way, you can create applications that require advanced data processing and analysis on SAP S/4HANA data.

The other kinds of applications are not suitable for on-stack developer extensibility, as they have different requirements and challenges. These kinds of applications are:

* Applications that integrate data from several different systems. On-stack developer extensibility is not meant for creating applications that integrate data from multiple sources, such as other SAP systems, third-party systems, or cloud services. This is

because on-stack developer extensibility does not support remote access or data replication, and it may cause performance or security issues. For this kind of applications, you should use side by side extensibility, which allows you to create applications that run on the SAP BTP and communicate with the SAP S/4HANA system via public APIs or events.

* Applications that run separate from SAP S/4HANA. On-stack developer extensibility is not meant for creating applications that run independently from the SAP S/4HANA system, such as standalone apps, microservices, or web apps. This is because on-stack developer extensibility requires a tight coupling with the SAP S/4HANA system, and it may limit the scalability, flexibility, and portability of the applications. For this kind of applications, you should use side by side extensibility, which allows you to create applications that run on the SAP BTP and leverage the cloud-native features and services of the platform.

NEW QUESTION # 76

What are some of the reasons that Core Data Services are preferable to the classical approach to data modeling? Note: There are 2 correct answers to this question.

- A. They transfer computational results to the application server.
- B. They avoid data transfer completely.
- C. They implement code pushdown.
- D. They compute results on the application server.

Answer: A,C

Explanation:

Core Data Services (CDS) are preferable to the classical approach to data modeling for several reasons, but two of them are:

* They implement code pushdown. Code pushdown is the principle of moving data-intensive logic from the application server to the database server, where the data resides. This reduces the data transfer between the application server and the database server, which improves the performance and scalability of the application. CDS enable code pushdown by allowing the definition of semantic data models and business logic in the database layer, using SQL and SQL-based expressions¹.

* They transfer computational results to the application server. CDS allow the application server to access the data and the logic defined in the database layer by using Open SQL statements. Open SQL is a standardized and simplified subset of SQL that can be used across different database platforms. Open SQL statements are translated into native SQL statements by the ABAP runtime environment and executed on the database server. The results of the computation are then transferred to the application server, where they can be further processed or displayed².
