Salesforce Certified MuleSoft Integration Foundations Sample Questions (Q19-Q24):

NEW QUESTION # 19

According to MuleSoft's IT delivery and operating model, which approach can an organization adopt in order to reduce the frequency of IT project delivery failures?

- A. Adopt an enterprise data model
- B. Prevent technology sprawl by reducing production of API assets
- C. Stop scope creep by centralizing requirements-gathering
- **D. Decouple central IT projects from the innovation that happens within each line of business**

Answer: D

Explanation:

The Problem (IT Delivery Gap): Traditional IT operating models often treat IT as a centralized factory, which becomes a bottleneck. The business demands change faster than Central IT can deliver, leading to project failures or delays.

The Solution (Decoupling): MuleSoft advocates for a new operating model (C4E) where Central IT produces reusable assets (System APIs) and then "gets out of the way." Innovation at the Edge: By decoupling core IT from the Line of Business (LOB), the LOB developers can self-serve those assets to build their own Process and Experience APIs. This allows innovation to happen in parallel across the organization, rather than waiting in a single queue, thus reducing failure rates associated with bottlenecks. 1111

NEW QUESTION # 20

An organization is choosing between API-led connectivity and other integration approaches.

- A. Higher outcome repeatability through centralized development
- B. Improved security through adoption of monolithic architectures
- C. Greater project predictability through tight coupling of systems
- **D. Increased developer productivity through self-service of API assets**

Answer: D

Explanation:

The Value Proposition: A primary goal of API-led connectivity is to close the IT delivery gap. It achieves this by turning APIs into reusable Assets published to Exchange. 8 Self-Service: When assets are discoverable, other developers (e.g., Line of Business developers) can reuse them without waiting for central IT to build everything from scratch. This "Self-Service" model significantly increases overall developer productivity.

Why others are incorrect:

Tight Coupling (B): API-led promotes loose coupling. Tight coupling makes systems brittle and hard to change (Point-to-Point).

Centralized Development (C): Creates a bottleneck. API-led enables federated development.

Monolithic (D): API-led breaks monoliths into composable services (Microservices/APIs).

NEW QUESTION # 21

A DevOps team has adequate observability of individual system behavior and performance, but it struggles to track the entire lifecycle of each request across different microservices. Which additional observability approach should this team consider adopting?

- A. Metrics
- B. Analytics
- C. Tracing
- D. Data mining

Answer: C

Explanation:

The Challenge: In a microservices architecture, a single user request might traverse dozens of different services. If an error occurs or latency is high, looking at the logs of just one service isn't enough.

Distributed Tracing: This is the specific technology used to track a request as it hops between services.

How it works: It assigns a unique Trace ID (Correlation ID) to the request at the entry point. This ID is passed to every downstream service. Tracing tools (like Anypoint Monitoring's Telemetry or Jaeger) verify the full path, showing exactly how long the request spent in each hop.

NEW QUESTION # 22

Which type of communication is managed by a service mesh in a microservices architecture?

- A. Communication between microservices developers
- B. Communication between microservices runtime administrators
- C. Communication between microservices
- D. Communication between trading partner services

Answer: C

Explanation:

Service Mesh Definition: A service mesh is a dedicated infrastructure layer for handling service-to-service communication.

East-West Traffic: It is specifically designed to manage East-West traffic, which is the network traffic flowing inside the data center or cluster between different microservices.

Capabilities: It handles things like mutual TLS (mTLS) for security, retries, load balancing, and traffic control between these services without requiring changes to the application code itself.

NEW QUESTION # 23

An API client makes an HTTP request to an API gateway with an Accept header containing the value "application/json".

- A. {"status": "healthy"}
- B. status('healthy')
- C. status: healthy
- D. status>healthy</status>

Answer: A

Explanation:

Content Negotiation: The HTTP Accept header is used by the client to tell the server what media type (format) it expects in the response.

application/json: This MIME type explicitly requests JSON (JavaScript Object Notation).

Analyzing the Options:

(B) {"status": "healthy"} is valid JSON format (Key-Value pair wrapped in braces).

(C) status>healthy</status> is XML.

(A) is YAML or Plain Text.
