Snowflake SnowPro Advanced: Data Engineer Certification Exam Sample Questions (Q156-Q161):

NEW QUESTION # 156

A company uses Amazon RDS for MySQL as the database for a critical application. The database workload is mostly writes, with a small number of reads.

A data engineer notices that the CPU utilization of the DB instance is very high. The high CPU utilization is slowing down the application. The data engineer must reduce the CPU utilization of the DB Instance.

Which actions should the data engineer take to meet this requirement? (Choose two.)

- A. Reboot the RDS DB instance once each week.
- B. Use the Performance Insights feature of Amazon RDS to identify queries that have high CPU utilization. Optimize the problematic queries.
- C. Implement caching to reduce the database query load.
- D. Upgrade to a larger instance size.
- E. Modify the database schema to include additional tables and indexes.

Answer: B,D

NEW QUESTION # 157

A company receives .csv files that contain physical address data. The data is in columns that have the following names: Door_No, Street_Name, City, and Zip_Code. The company wants to create a single column to store these values in the following format:

Which solution will meet this requirement with the LEAST coding effort?

- A. Write a Lambda function in Python to read the files. Use the Python data dictionary type to create the new column.
- B. Use AWS Glue DataBrew to read the files. Use the NEST_TO_ARRAY transformation to create the new column.
- C. Use AWS Glue DataBrew to read the files. Use the NEST_TO_MAP transformation to create the new column.
- D. Use AWS Glue DataBrew to read the files. Use the PIVOT transformation to create the new column.

Answer: C

NEW QUESTION # 158

A Data Engineer is working on a Snowflake deployment in AWS eu-west-1 (Ireland). The Engineer is planning to load data from staged files into target tables using the copy into command Which sources are valid? (Select THREE)

- A. External stage on GCP us-centrall (Iowa)
- B. SSO attached to an Amazon EC2 instance on AWS eu-west-1 (Ireland)
- C. Internal stage on GCP us-centrall (Iowa)
- D. External stage in an Amazon S3 bucket on AWS eu-central 1 (Frankfurt)
- E. External stage in an Amazon S3 bucket on AWS eu-west-1 (Ireland)
- F. Internal stage on AWS eu-central-1 (Frankfurt)

Answer: A,D,E

Explanation:

Explanation

The valid sources for loading data from staged files into target tables using the copy into command are:

External stage on GCP us-centrall (Iowa): This is a valid source because Snowflake supports cross-cloud data loading from external stages on different cloud platforms and regions than the Snowflake deployment.

External stage in an Amazon S3 bucket on AWS eu-west-1 (Ireland): This is a valid source because Snowflake supports data loading from external stages on the same cloud platform and region as the Snowflake deployment.

External stage in an Amazon S3 bucket on AWS eu-central 1 (Frankfurt): This is a valid source because Snowflake supports cross-region data loading from external stages on different regions than the Snowflake deployment within the same cloud platform. The invalid sources are:

Internal stage on GCP us-centrall (Iowa): This is an invalid source because internal stages are always located on the same cloud platform and region as the Snowflake deployment. Therefore, an internal stage on GCP us-centrall (Iowa) cannot be used for a Snowflake deployment on AWS eu-west-1 (Ireland).

Internal stage on AWS eu-central-1 (Frankfurt): This is an invalid source because internal stages are always located on the same

region as the Snowflake deployment. Therefore, an internal stage on AWS eu-central-1 (Frankfurt) cannot be used for a Snowflake deployment on AWS eu-west-1 (Ireland).

SSO attached to an Amazon EC2 instance on AWS eu-west-1 (Ireland): This is an invalid source because SSO stands for Single Sign-On, which is a security integration feature in Snowflake, not a data staging option.

NEW QUESTION # 159

A company uses an AWS Lambda function to transfer files from a legacy SFTP environment to Amazon S3 buckets. The Lambda function is VPC enabled to ensure that all communications between the Lambda function and other AWS services that are in the same VPC environment will occur over a secure network.

The Lambda function is able to connect to the SFTP environment successfully. However, when the Lambda function attempts to upload files to the S3 buckets, the Lambda function returns timeout errors. A data engineer must resolve the timeout issues in a secure way.

Which solution will meet these requirements in the MOST cost-effective way?

- A. Create a NAT gateway in the public subnet of the VPC. Route network traffic to the NAT gateway.
- **B. Create a VPC gateway endpoint for Amazon S3. Route network traffic to the VPC gateway endpoint.**
- C. Use a VPC internet gateway to connect to the internet. Route network traffic to the VPC internet gateway.
- D. Create a VPC interface endpoint for Amazon S3. Route network traffic to the VPC interface endpoint.

Answer: B

Explanation:

While interface endpoints is a viable solution, it can be more complex and expensive compared to a gateway endpoint. VPC interface endpoints charge per hour and per gigabyte of data transferred.

NEW QUESTION # 160

Which system role is recommended for a custom role hierarchy to be ultimately assigned to?

- **A. SECURITYADMIN**
- B. USERADMIN
- C. ACCOUNTADMIN
- D. SYSTEMADMIN

Answer: A

Explanation:

Explanation

The system role that is recommended for a custom role hierarchy to be ultimately assigned to is SECURITYADMIN. This role has the manage grants privilege on all objects in an account, which allows it to grant access privileges to other roles or revoke them as needed. This role can also create or modify custom roles and assign them to users or other roles. By assigning custom roles to SECURITYADMIN, the role hierarchy can be managed centrally and securely. The other options are not recommended system roles for a custom role hierarchy to be ultimately assigned to. Option A is incorrect because ACCOUNTADMIN is the most powerful role in an account, which has full access to all objects and operations. Assigning custom roles to ACCOUNTADMIN can pose a security risk and should be avoided. Option C is incorrect because SYSTEMADMIN is a role that has full access to all objects in the public schema of the account, but not to other schemas or databases. Assigning custom roles to SYSTEMADMIN can limit the scope and flexibility of the role hierarchy. Option D is incorrect because USERADMIN is a role that can manage users and roles in an account, but not grant access privileges to other objects. Assigning custom roles to USERADMIN can prevent the role hierarchy from controlling access to data and resources.
