問題 #16

A data engineering team has noticed that their Databricks SQL queries are running too slowly when they are submitted to a non-running SQL endpoint. The data engineering team wants this issue to be resolved.

Which of the following approaches can the team use to reduce the time it takes to return results in this scenario?

- A. They can turn on the Auto Stop feature for the SQL endpoint.
- B. They can increase the maximum bound of the SQL endpoint's scaling range
- C. They can turn on the Serverless feature for the SQL endpoint and change the Spot Instance Policy to "Reliability Optimized."
- D. They can turn on the Serverless feature for the SQL endpoint.
- E. They can increase the cluster size of the SQL endpoint.

答案：D

解題說明：

Option D is the correct answer because it enables the Serverless feature for the SQL endpoint, which allows the endpoint to automatically scale up and down based on the query load. This way, the endpoint can handle more concurrent queries and reduce the time it takes to return results. The Serverless feature also reduces the cold start time of the endpoint, which is the time it takes to start the cluster when a query is submitted to a non- running endpoint. The Serverless feature is available for both AWS and Azure Databricks platforms.

問題 #17

Which of the following benefits of using the Databricks Lakehouse Platform is provided by Delta Lake?

- A. The ability to set up alerts for query failures
- B. The ability to collaborate in real time on a single notebook
- C. The ability to distribute complex data operations
- D. The ability to manipulate the same data using a variety of languages
- E. The ability to support batch and streaming workloads

答案：E

解題說明：

Delta Lake is the optimized storage layer that provides the foundation for storing data and tables in the Databricks lakehouse. Delta Lake is fully compatible with Apache Spark APIs, and was developed for tight integration with Structured Streaming, allowing you to easily use a single copy of data for both batch and streaming operations and providing incremental processing at scale1. Delta Lake supports upserts using the merge operation, which enables you to efficiently update existing data or insert new data into your Delta tables2. Delta Lake also provides time travel capabilities, which allow you to query previous versions of your data or roll back to a specific point in time3. 問題 #18

A data engineer is writing a script that is meant to ingest new data from cloud storage. In the event of the Schema change, the ingestion should fail. It should fail until the changes downstream source can be found and verified as intended changes.
Which command will meet the requirements?

- A. none
- B. rescue
- C. failOnNewColumns
- D. addNewColumns

答案：C

問題 #19

A data engineering team has noticed that their Databricks SQL queries are running too slowly when they are submitted to a non-running SQL endpoint. The data engineering team wants this issue to be resolved.
Which of the following approaches can the team use to reduce the time it takes to return results in this scenario?

- A. They can turn on the Serverless feature for the SQL endpoint and change the Spot Instance Policy to "Reliability Optimized."
- B. They can turn on the Auto Stop feature for the SQL endpoint.
- C. They can increase the maximum bound of the SQL endpoint's scaling range
- D. They can turn on the Serverless feature for the SQL endpoint.
- E. They can increase the cluster size of the SQL endpoint.

答案：D

解題說明：
Option D is the correct answer because it enables the Serverless feature for the SQL endpoint, which allows the endpoint to automatically scale up and down based on the query load. This way, the endpoint can handle more concurrent queries and reduce the time it takes to return results. The Serverless feature also reduces the cold start time of the endpoint, which is the time it takes to start the cluster when a query is submitted to a non-running endpoint. The Serverless feature is available for both AWS and Azure Databricks platforms.

問題 #20
Which of the following commands will return the number of null values in the member_id column?

- A. SELECT count_null(member_id) FROM my_table;
- B. SELECT null(member_id) FROM my_table;
- C. SELECT count_if(member_id IS NULL) FROM my_table;
- D. SELECT count(member_id) - count_null(member_id) FROM my_table;
- E. SELECT count(member_id) FROM my_table;

答案：C

解題說明：
To return the number of null values in the member_id column, the best option is to use the count_if function, which counts the number of rows that satisfy a given condition. In this case, the condition is that the member_id column is null. The other options are either incorrect or not supported by Spark SQL. Option A will return the number of non-null values in the member_id column. Option B will not work because there is no count_null function in Spark SQL. Option D will not work because there is no null function in Spark SQL.
Option E will not work because there is no count_null function in Spark SQL. References:
