Linux Foundation Certified GitOps Associate Sample Questions (Q53-Q58):

NEW QUESTION # 53
Which two GitOps controllers are the most popular?

- A. ArgoCD and Flux
- B. Helm and Kustomize
- C. Keptn and Puppet
- D. Jenkins and Tekton

Answer: A

Explanation:
The two most widely adopted GitOps controllers in the CNCF ecosystem areArgoCDandFlux. Both implement the GitOps principles of continuous reconciliation from Git as the source of truth.
"ArgoCD and Flux are the two primary CNCF GitOps controllers. They implement reconciliation loops to ensure the desired state in Git matches the cluster's actual state." Thus, the correct answer isC.

NEW QUESTION # 54
What is the main difference between Terraform/OpenTofu and Ansible?

- A. Terraform/OpenTofu uses a configuration language called CUE, while Ansible uses HCL.
- B. Ansible is written in Golang, while Terraform/OpenTofu is written in Python.
- C. Terraform/OpenTofu stores the state of each resource, while Ansible works in a fire-and-forget mode.
- D. Terraform/OpenTofu is imperative in nature, while Ansible is declarative.

Answer: C

Explanation:
Terraform (or OpenTofu) uses a declarative model and maintains a state file to track the current status of resources, enabling it to plan and reconcile changes. Ansible, by contrast, is more procedural and executes tasks in a fire-and-forget manner, without tracking persistent resource state.
"Terraform maintains state for each managed resource, enabling planned, consistent changes. Ansible executes tasks without tracking resource state, working in a fire-and-forget model." Thus, the correct answer is B.

NEW QUESTION # 55
How do you ensure that you are achieving the Pulled Automatically GitOps principle?

- A. By deploying changes from the version control repository by applying them through an automated pipeline when major updates are needed.
- B. By manually triggering deployments and configurations using scripts and commands.
- C. By having an operator continuously monitor and pull changes from the source of truth.
- D. By maintaining multiple Git repositories for different aspects of your infrastructure and applications.

Answer: C

Explanation:
The Pulled Automatically principle in GitOps means that agents inside the runtime environment (e.g., controllers/operators) continuously monitor Git (the source of truth) and automatically pull changes when updates are detected.
"Software agents continuously pull changes from the version control system and reconcile them automatically. This pull-based approach ensures automation, security, and self-healing." Thus, the correct answer is B.
References: GitOps Principles (CNCF GitOps Working Group), Principle 4: Continuously reconciled and pulled automatically.

NEW QUESTION # 56
How can you achieve the declarative GitOps principle in managing infrastructure and applications?

- A. By using imperative scripting languages to automate infrastructure changes.
- B. By manually making ad-hoc configuration changes directly in the production environment.
- C. By periodically creating manual backups of your infrastructure configurations.
- D. By defining and maintaining infrastructure and application configurations declaratively in a version- controlled system.

Answer: D

Explanation:
The first GitOps principle is Declarative Descriptions. This means the desired system configuration (for infrastructure, services, and applications) is expressed declaratively and stored in version control. Git becomes the single source of truth.
"The desired system state must be expressed declaratively. This provides a clear, machine-readable blueprint for the system, and ensures that what is in Git is what should be running in the environment." Therefore, infrastructure and application configurations must be defined declaratively and stored in Git, not managed imperatively or manually.
References: GitOps Principles (CNCF GitOps Working Group), Principle 1: The system is described declaratively.

NEW QUESTION # 57
You want to create a dashboard to monitor the performance of your application. Which of the following is a key principle of GitOps

regarding dashboards?

- A. Dashboards should be created using a proprietary tool.
- B. The operations team should manually update dashboards.
- C. Dashboards should only be accessible to the development team.
- D. Dashboards declarations should be in the Desired State store.

Answer: D

Explanation:
In GitOps,everything that defines the system, including dashboards, must be stored declaratively in Git(the Desired State store). This ensures dashboards are versioned, reproducible, and consistent across environments.
"GitOps requires that all system components, including monitoring and observability configurations such as dashboards, are declared in Git. This ensures they are versioned, immutable, and reproducible." Thus,Dis correct.
