We compile Our B2B-Commerce-Developer preparation questions elaborately and provide the wonderful service to you thus you can get a good learning and preparation for the exam.

Salesforce Accredited B2B Commerce Developer Sample Questions (Q171-Q176):

NEW QUESTION # 171

Which technique can be used with Lightning web components to expose them outside of an org in another web container?

- A. Lightning Out
- B. Lightning Canvas
- C. Heroku
- D. Slot elements

Answer: A

Explanation:

Explanation

According to the Lightning Web Components Developer Guide, Lightning Out is a technique that allows developers to run Lightning web components outside of Salesforce servers, such as in a Node.js app running on Heroku or a department server inside the firewall. Lightning Out uses a script tag to load the Lightning web components framework and the custom components into the web container. Lightning Out also handles authentication, event handling, and data access between the web container and the Salesforce org. Slot elements, Heroku, and Lightning Canvas are not techniques for exposing Lightning web components outside of an org in another web container. NEW QUESTION # 172

Which three actions are applicable when extending a default Salesforce B2B Commerce page via a page include? (3 answers)

- A. Build and activate a new configuration cache setting via CC admin.
- B. Create the VisualForce page you wish to include to the Salesforce B2B Commerce page.
- C. Create a configuration setting for enabling the page include and assigning the new page include via CC admin.
- D. Prepend "c." to the name of the page referenced in the configuration setting.
- E. Create a Service Class override to query the new page include.

Answer: A,B,C

Explanation:

Three actions that are applicable when extending a default Salesforce B2B Commerce page via a page include are:

* Create the VisualForce page you wish to include to the Salesforce B2B Commerce page. This page will contain the custom content or logic that you want to add to the existing page. For example, you can create a VisualForce page named MyPageInclude that displays some additional information or functionality on the product detail page.

* Create a configuration setting for enabling the page include and assigning the new page include via CC Admin. This setting will specify which page include you want to use for which page and section. For example, you can create a configuration setting named CO.MyPageInclude with the value PDV.

BodyIncludeBegin.MyPageInclude, which means you want to use MyPageInclude as the body include begin for the product detail view (PDV) page.

* Build and activate a new configuration cache setting via CC Admin. This action will refresh the cache and apply the changes to the storefront. You need to do this whenever you make any changes to the configuration settings or VisualForce pages. Salesforce

NEW QUESTION # 173

Northern Tail Outfitters (NTO) is converting an existing aura component into a Lightning Web Component. The aura component has the following source code:

```
<!-- owner.cmp -->
<aura:component>
  <aura:attribute name="fName" type="String" />
  <c:child firstName="{!v.fName}" />
</aura:component>
```

What is the equivalent of this code in a Lightning Web Component?

- A.

```
<!-- owner.html -->
<template>
  <c-child first-name={item.fName}></child>
</template>
```
- B.

```
<!-- owner.html -->
<template>
  <c-child first-name={fName}></child>
</template>
```
- C.

```
<!-- owner.html -->
<template>
  <c-child first-name={<fName>}></child>
</template>
```
- D.

```
<!-- owner.html -->
<template>
  <c-child first-name={!fName}></child>
</template>
```

Answer: B

Explanation:

The equivalent of this code in a Lightning web component is option B. Option B uses the `@api` decorator to expose `firstName` as a public property of the Lightning web component and communicate it with other components or services. The `@api` decorator is a decorator that marks a property or method as public, which means that it can be accessed by other components or services that use or consume this component. The `@api` decorator also makes the property reactive, which means that it can track changes and update the component accordingly. In option B, `firstName` is exposed as a public property using the `@api` decorator and passed to the child element using an attribute. Option A is incorrect because it uses an invalid syntax for exposing `firstName` as a public property. The `@api` decorator should be used before the property declaration, not after it. Option C is incorrect because it uses an invalid syntax for exposing `firstName` as a public property. The `@api` decorator should be used with parentheses, not without them. Option D is incorrect because it uses an invalid syntax for exposing `firstName` as a public property. The `@api` decorator should be used with camel case, not with hyphens. NEW QUESTION # 174

Which three statements are true regarding event handling in the Salesforce B2B Commerce managed package?
(3 answers)

- A. Salesforce B2B Commerce relies on a central event channel for communication across various Salesforce B2B Commerce Backbone Views and Models called CCRZ.pubSub.
- B. CCRZ.pubSub defines the following three functions which can be used for event handling: trigger, on, and once.
- C. Salesforce B2B Commerce relies on a series of Javascript click listener events.
- D. Writing directly to your own custom Backbone JS Views and Models automatically integrates that data into the Salesforce B2B Commerce Backbone Views and Models.
- E. CCRZ.pubSub extends the Backbone.Events JavaScript object.

Answer: A,B,E

NEW QUESTION # 175

What are the templating, Javascript, and CSS frameworks what the cloudcraze managed package leverages?

- A. Angularjs, react.js, and handlebarsjs
- B. Bootstrap, Backbonejs, and handlebarsjs
- C. Angularjs, Backbonejs, and handlebarsjs
- D. Bootstrap, Angularjs, and Backbonejs

Answer: B

NEW QUESTION # 176

.....
