2023 C1000-130 Guide - Authorized C1000-130 Pdf, Valid IBM Cloud Pak for Integration V2021.2 Administration Exam Syllabus

P.S. Free & New C1000-130 dumps are available on Google Drive shared by FreePdfDump: [https://drive.google.com/open?id=1-\\_qycYiPPmlrcFtYgvYg83FygcjPRkkU](https://drive.google.com/open?id=1-_qycYiPPmlrcFtYgvYg83FygcjPRkkU)

The clients can consult our online customer service before and after they buy our C1000-130 useful test guide. We provide considerate customer service to the clients. Before the clients buy our C1000-130 cram training materials they can consult our online customer service personnel about the products' version and price and then decide whether to buy them or not. After the clients buy the C1000-130 Study Tool they can consult our online customer service about how to use them and the problems which occur during the process of using. We will help you pass the C1000-130 exam in the shortest time.

As is known to us, the quality is an essential standard for a lot of people consuming movements, and the high quality of the C1000-130 guide questions is always reflected in the efficiency. We are glad to tell you that the C1000-130 actual dumps from our company have a high quality and efficiency. If you decide to choose C1000-130 Actual Dumps as you first study tool, it will be very possible for you to pass the exam successfully, and then you will get the related certification in a short time.

## We will Help You in Passing the IBM C1000-130 Certification Exam

Perhaps you have wasted a lot of time to playing computer games. It doesn't matter. It is never too late to change. There is no point

in regretting for the past. Our C1000-130 exam questions can help you compensate for the mistakes you have made in the past. You will change a lot after learning our C1000-130 Study Materials. And most of all, you will get reward by our C1000-130 training engine in the least time with little effort.

## IBM Cloud Pak for Integration V2021.2 Administration Sample Questions (Q50-Q55):

### NEW QUESTION # 50

What is the default time period for the data retrieved by the License Service?

- A. The full period from the deployment.
- B. 30 days.
- C. 90 days.
- D. 60 days.

**Answer: C**

Explanation:

In IBM Cloud Pak for Integration (CP4I) v2021.2, the IBM License Service collects and retains license usage data for a default period of 90 days. This data is crucial for auditing and compliance, ensuring that software usage aligns with licensing agreements. Key Details About the IBM License Service Data Retention:

The IBM License Service continuously collects and stores licensing data.

By default, it retains data for 90 days before older data is automatically removed.

Users can query and retrieve usage reports from this 90-day period.

The License Service supports regulatory compliance by ensuring transparent tracking of software usage.

Why Not the Other Options?

B . The full period from the deployment - Incorrect. The License Service does not retain data indefinitely; it follows a rolling 90-day retention policy.

C . 30 days - Incorrect. The default retention period is longer than 30 days.

D . 60 days - Incorrect. The default is 90 days, not 60.

### NEW QUESTION # 51

Which statement is true about the Confluent Platform capability for the IBM Cloud Pak for Integration?

- A. It provides APIs to discover applications, platforms, and infrastructure in the environment.
- B. It provides the ability to trace transactions through IBM Cloud Pak for Integration.
- C. It provides a capability that allows user to store, manage, and retrieve integration assets in IBM Cloud Pak for Integration.
- D. It provides an event-streaming platform to organize and manage data from many different sources with one reliable, high performance system.

**Answer: D**

Explanation:

IBM Cloud Pak for Integration (CP4I) includes Confluent Platform as a key capability to support event-driven architecture and real-time data streaming. The Confluent Platform is built on Apache Kafka, providing robust event-streaming capabilities that allow organizations to collect, process, store, and manage data from multiple sources in a highly scalable and reliable manner.

This capability is essential for real-time analytics, event-driven microservices, and data integration between various applications and services. With its high-performance messaging backbone, it ensures low-latency event processing while maintaining fault tolerance and durability.

Explanation of Other Options:

A . It provides the ability to trace transactions through IBM Cloud Pak for Integration.

Incorrect. Transaction tracing and monitoring are primarily handled by IBM Cloud Pak for Integration's API Connect, App Connect, and Instana monitoring tools, rather than Confluent Platform itself.

B . It provides a capability that allows users to store, manage, and retrieve integration assets in IBM Cloud Pak for Integration.

Incorrect. IBM Asset Repository and IBM API Connect are responsible for managing integration assets, not Confluent Platform.

C . It provides APIs to discover applications, platforms, and infrastructure in the environment.

Incorrect. This functionality is more aligned with IBM Instana, IBM Cloud Pak for Multicloud Management, or OpenShift Discovery APIs, rather than the event-streaming capabilities of Confluent Platform.

### NEW QUESTION # 52

Red Hat OpenShift GitOps organizes the deployment process around repositories. It always has at least two repositories, an Application repository with the source code and what other repository?

- A. Nexus
- B. Ansible configuration
- C. Environment configuration
- D. Maven

**Answer: C**

### NEW QUESTION # 53

Which statement is true regarding the DataPower Gateway operator?

- A. The operator creates the DataPowerService as a DaemonSet.
- B. The operator creates the DataPowerService as a StatefulSet.
- C. The operator creates the DataPowerService as a ReplicaSet.
- D. The operator creates the DataPowerService as a Deployment.

**Answer: B**

Explanation:

In IBM Cloud Pak for Integration (CP4I) v2021.2, the DataPower Gateway operator is responsible for managing DataPower Gateway deployments within an OpenShift environment. The correct answer is StatefulSet because of the following reasons:

Why is DataPowerService created as a StatefulSet?

Persistent Identity & Storage:

A StatefulSet ensures that each DataPowerService instance has a stable, unique identity and persistent storage (e.g., for logs, configurations, and stateful data).

This is essential for DataPower since it maintains configurations that should persist across pod restarts.

Ordered Scaling & Upgrades:

StatefulSets provide ordered, predictable scaling and upgrades, which is important for enterprise gateway services like DataPower.

Network Identity Stability:

Each pod in a StatefulSet gets a stable network identity with a persistent DNS entry.

This is critical for DataPower appliances, which rely on fixed hostnames and IPs for communication.

DataPower High Availability:

StatefulSets help maintain high availability and proper state synchronization between multiple instances when deployed in an HA mode.

Why are the other options incorrect?

☐ Option A (DaemonSet):

DaemonSets ensure that one pod runs on every node, which is not necessary for DataPower.

DataPower requires stateful behavior and ordered deployments, which DaemonSets do not provide.

☐ Option B (Deployment):

Deployments are stateless, while DataPower needs stateful behavior (e.g., persistence of certificates, configurations, and transaction data).

Deployments create identical replicas without preserving identity, which is not suitable for DataPower.

☐ Option D (ReplicaSet):

ReplicaSets only ensure a fixed number of running pods but do not manage stateful data or ordered scaling.

DataPower requires persistence and ordered deployment, which ReplicaSets do not support.

#### NEW QUESTION # 54

What is the minimum number of Elasticsearch nodes required for a highly-available logging solution?

- A. 0
- **B. 1**
- C. 2
- D. 3

**Answer: B**

Explanation:

In IBM Cloud Pak for Integration (CP4I) v2021.2, which runs on Red Hat OpenShift, logging is handled using the OpenShift Logging Operator, which often utilizes Elasticsearch as the log storage backend.

For a highly available (HA) Elasticsearch cluster, the minimum number of nodes required is 3.

Why Are 3 Elasticsearch Nodes Required for High Availability?

Elasticsearch uses a quorum-based system for cluster state management.

A minimum of three nodes ensures that the cluster can maintain a quorum in case one node fails.

HA requires at least two master-eligible nodes, and with three nodes, the system can elect a new master if the active one fails.

Replication across three nodes prevents data loss and improves fault tolerance.

Example Elasticsearch Deployment for HA:

A standard HA Elasticsearch setup consists of:

3 master-eligible nodes (manage cluster state).

At least 2 data nodes (store logs and allow redundancy).

Optional client nodes (handle queries to offload work from data nodes).

Why Answer C (3) is Correct?

Ensures HA by allowing Elasticsearch to withstand node failures without loss of cluster control.

Prevents split-brain scenarios, which occur when an even number of nodes (e.g., 2) cannot reach a quorum.

Recommended by IBM and Red Hat for OpenShift logging solutions.

Explanation of Incorrect Answers:

A . 1 → Incorrect

A single-node Elasticsearch deployment is not HA because if the node fails, all logs are lost.

B . 2 → Incorrect

Two nodes cannot form a quorum, meaning the cluster cannot elect a leader reliably.

This could lead to split-brain scenarios or a complete failure when one node goes down.

D . 7 → Incorrect

While a larger cluster (e.g., 7 nodes) improves scalability and performance, it is not the minimum requirement for HA.

Three nodes are sufficient for high availability.
