

2026 New CTFL-AT Study Materials: ISTQB Certified Tester - Foundation Level Extension - Agile Tester - Unparalleled Free PDF Quiz CTFL-AT

P.S. Free & New CTFL-AT dumps are available on Google Drive shared by Pass4Test: <https://drive.google.com/open?id=1cd6Br9MFOiAhfjMAQCieIlqAMjTomqtF>

In this era of the latest technology, we should incorporate interesting facts, figures, visual graphics, and other tools that can help people read the ISTQB Certified Tester - Foundation Level Extension - Agile Tester (CTFL-AT) exam questions with interest. Pass4Test uses pictures that are related to the ISTQB Certified Tester - Foundation Level Extension - Agile Tester (CTFL-AT) certification exam and can even add some charts, and graphs that show the numerical values.

ISQI CTFL-AT (ISTQB Certified Tester - Foundation Level Extension - Agile Tester) Certification Exam is an important certification for individuals who are involved in the agile development process. It assesses the candidate's knowledge and skills in agile testing, and is recognized globally in the software testing industry. ISTQB Certified Tester - Foundation Level Extension - Agile Tester certification can greatly enhance the candidate's career prospects and is a requirement for advanced certifications in the field of software testing.

ISQI CTFL-AT New Questions - CTFL-AT Braindumps Torrent

There may be a lot of people feel that the preparation process for exams is hard and boring, and hard work does not necessarily mean good results, which is an important reason why many people are afraid of examinations. Today, our CTFL-AT study materials

will radically change this. High question hit rate makes you no longer aimless when preparing for the exam, so you just should review according to the content of our CTFL-AT Study Materials prepared for you. Instant answer feedback allows you to identify your vulnerabilities in a timely manner, so as to make up for your weaknesses.

ISQI ISTQB Certified Tester - Foundation Level Extension - Agile Tester Sample Questions (Q22-Q27):

NEW QUESTION # 22

Which of the following statements about Agile retrospectives is CORRECT?

- A. Agile retrospectives should be focused mainly on impediments that are outside the control of the team because these issues are more challenging.
- B. Unlike working sessions or meetings held in non-Agile projects, Agile retrospectives do not require follow-up activities.
- C. During Agile retrospectives, testers should be encouraged to provide constructive suggestions only on non-testing activities.
- **D. In an Agile retrospective the moderator can encourage and make sure that good practices are kept by the team, by asking what the team is doing well.**

Answer: D

Explanation:

An Agile retrospective is a regular meeting where the team reflects on their work process and identifies the areas for improvement. The following statements about Agile retrospectives are correct:

* During Agile retrospectives, testers should be encouraged to provide constructive suggestions on both testing and non-testing activities, as testing is an integral part of the Agile team and testers can contribute to the overall quality of the product and the process.

* In an Agile retrospective, the moderator can encourage and make sure that good practices are kept by the team, by asking what the team is doing well. This helps to reinforce the positive aspects of the team's work and to appreciate the team members' efforts and achievements.

* Agile retrospectives should be focused mainly on impediments that are within the control of the team because these issues are more actionable and can be resolved by the team. Impediments that are outside the control of the team should also be discussed, but they may require the involvement of other stakeholders or external parties to be addressed.

The following statement about Agile retrospectives is incorrect:

* Unlike working sessions or meetings held in non-Agile projects, Agile retrospectives do require follow-up activities. The team should agree on the action items that result from the retrospective and assign them to the responsible team members. The team should also monitor the progress and effectiveness of the action items in the next iteration and review them in the next retrospective. Therefore, the correct answer is B, as it is the only statement that is correct about Agile retrospectives. NEW QUESTION # 23

Which of the following sentences about the integration of development and testing activities in Agile projects is INCORRECT?

- A. Developers and testers may work as a pair to develop and test a feature.
- B. While developers develop automated unit test scripts, testers write automated system level tests.
- **C. Testers replace developers in writing unit test automation scripts.**
- D. Developers write acceptance criteria and test cases, together with testers.

Answer: C

Explanation:

Explanation

Testers replace developers in writing unit test automation scripts. Comprehensive Explanation: The integration of development and testing activities in Agile projects is based on the principle of cross-functional teamwork, where all team members collaborate and share their skills and knowledge to achieve a common goal. In the context of testing, this means that testing is not seen as a separate activity or phase, but as an integral part of the development process. Therefore, the following sentences are correct:

While developers develop automated unit test scripts, testers write automated system level tests. This is an example of how developers and testers can work in parallel and complement each other's testing efforts. Developers can focus on testing the internal quality of the code, while testers can focus on testing the external quality of the product.

Developers write acceptance criteria and test cases, together with testers. This is an example of how developers and testers can work together to define and verify the user requirements and expectations.

Developers can provide their technical expertise and input, while testers can provide their business and user perspective and feedback.

Developers and testers may work as a pair to develop and test a feature. This is an example of how developers and testers can work closely and interactively to deliver a feature. Developers and testers can exchange ideas, suggestions, and information, and support each other in the coding and testing tasks.

The following sentence is incorrect:

Testers replace developers in writing unit test automation scripts. This is not a valid example of the integration of development and testing activities in Agile projects, because it implies that testers take over the responsibility of developers, rather than collaborate with them. Testers should not replace developers in writing unit test automation scripts, because developers have more knowledge and experience in coding and debugging, and because unit testing is an essential part of the development process. Testers should instead work with developers to ensure that the unit test automation scripts are adequate, effective, and maintainable. NEW QUESTION # 24

Which two of the following statements are CORRECT with regards to test automation on agile projects?

- 1) Every test developed for past iterations is kept and executed as part of a regression suite for each new release of code.
- 2) It would be very difficult to ensure high quality in an agile project without test automation.
- 3) Automated acceptance tests are run regularly as part of the continuous integration full system build.
- 4) Automated regression suites are only run for the final release of code.
- 5) In agile projects, the results from automated acceptance tests provide feedback on the overall product quality.

- A. 2, 3
- B. 2, 5
- C. 3, 4
- D. 1, 3

Answer: B

NEW QUESTION # 25

Which agile development approach incorporates the following practices:

- * a project is divided into iterations called sprints
- * each sprint results in a potentially releasable/shippable product?

- A. Scrum
- B. Continuous Integration
- C. Kanban
- D. Extreme Programming

Answer: A

NEW QUESTION # 26

Why is regression of software a high risk in agile projects?

- A. Regression is built into software as a safeguard against unexpected failures.
- B. There is code churn due to change in business needs over several sprints.
- C. Test-driven development means that existing functionality is not considered.
- D. Test automation can cause regression of software in the test environment.

Answer: B

Explanation:

Explanation

Regression of software is the risk that a change in one part of the software causes a defect in another part of the software that was previously working correctly. Regression of software is a high risk in agile projects because there is code churn due to change in business needs over several sprints. Code churn is the amount of code that is added, modified, or deleted in a software project over time. Code churn can indicate the volatility and complexity of the software, and the frequency and magnitude of the changes. In agile

projects, code churn can be high because the business needs and the user requirements can change rapidly and frequently over several sprints, which are short iterations of development and testing. This means that the software is constantly evolving and adapting to the changing needs, and that the existing functionality and quality may be affected by the new or modified code. Therefore, regression of software is a high risk in agile projects, and it requires effective testing strategies and techniques to prevent, detect, and fix the regression defects.
