Amazon AWS Certified Solutions Architect - Professional Sample Questions (Q298-Q303):

NEW QUESTION # 298

Your application provides data transformation services. Files containing data to be transformed are first uploaded to Amazon S3 and then transformed by a fleet of spot EC2 instances. Files submitted by your premium customers must be transformed with the highest priority. How should you implement such a system?

- A. Use a single SQS queue. Each message contains the priority level. Transformation instances poll high-priority messages first.
- B. Use a DynamoDB table with an attribute defining the priority level. Transformation instances will scan

the table for tasks, sorting the results by priority level.

- C. Use two SQS queues, one for high priority messages, the other for default priority. Transformation instances first poll the high priority queue; if there is no message, they poll the default priority queue.
- D. Use Route 53 latency based-routing to send high priority tasks to the closest transformation instances.

Answer: C

NEW QUESTION # 299

A company has purchased appliances from different vendors. The appliances all have IoT sensors. The sensors send status information in the vendors' proprietary formats to a legacy application that parses the information into JSON. The parsing is simple, but each vendor has a unique format. Once daily, the application parses all the JSON records and stores the records in a relational database for analysis.

The company needs to design a new data analysis solution that can deliver faster and optimize costs.

Which solution will meet these requirements?

- A. Create an AWS Transfer for SFTP server. Update the IoT sensor code to send the information as a .csv file through SFTP to the server. Use AWS Glue to catalog the files. Use Amazon Athena for analysis.
- B. Migrate the application server to AWS Fargate, which will receive the information from IoT sensors and parse the information into a relational format. Save the parsed information to Amazon Redshift for analysis.
- C. Use AWS Snowball Edge to collect data from the IoT sensors directly to perform local analysis. Periodically collect the data into Amazon Redshift to perform global analysis.
- D. Connect the IoT sensors to AWS IoT Core. Set a rule to invoke an AWS Lambda function to parse the information and save a .csv file to Amazon S3. Use AWS Glue to catalog the files. Use Amazon Athena and Amazon QuickSight for analysis.

Answer: D

Explanation:

Explanation

* Connect the IoT sensors to AWS IoT Core. Set a rule to invoke an AWS Lambda function to parse the information and save a .csv file to Amazon S3. Use AWS Glue to catalog the files. Use Amazon Athena and Amazon QuickSight for analysis. This solution meets the requirement of faster analysis and cost optimization by using AWS IoT Core to collect data from the IoT sensors in real-time and then using AWS Glue and Amazon Athena for efficient data analysis.

This solution involves connecting the IoT sensors to the AWS IoT Core, setting a rule to invoke an AWS Lambda function to parse the information, and saving a .csv file to Amazon S3. AWS Glue can be used to catalog the files and Amazon Athena and Amazon QuickSight can be used for analysis. This solution will enable faster and more cost-effective data analysis.

This solution is in line with the official Amazon Textbook and Resources for the AWS Certified Solutions Architect - Professional certification. In particular, the book states that: "AWS IoT Core can be used to ingest and process the data, AWS Lambda can be used to process and transform the data, and Amazon S3 can be used to store the data. AWS Glue can be used to catalog and access the data, Amazon Athena can be used to query the data, and Amazon QuickSight can be used to visualize the data." NEW QUESTION # 300

Your company is getting ready to do a major public announcement of a social media site on AWS. The website is running on EC2 instances deployed across multiple Availability Zones with an Multi-AZ RDS MySQL Extra Large DB Instance backend. The site performs a high number of small reads and writes per second and relies on an eventual consistency model. After comprehensive tests you discover that there is read contention on RDS MySQL.

Which are the best approaches to meet these requirements? Choose 2 answers

- A. Implement sharding to distribute load to multiple RDS MySQL Instances.
- B. Increase the RDS MySQL instance size and implement provisioned IOPS.
- C. Deploy ElastiCache in-memory cache running in each availability zone.
- D. Add an RDS MySQL read replica in each availability zone.

Answer: C,D

NEW QUESTION # 301

What does elasticity mean to AWS?

- A. The ability to scale computing resources up and down easily, with minimal friction.
- B. The ability to provision cloud computing resources in expectation of future demand.
- C. The ability to scale computing resources up easily, with minimal friction and down with latency.
- D. The ability to recover from business continuity events with minimal friction.

Answer: A

NEW QUESTION # 302

Which statement is NOT true about accessing remote AWS region in the US by your AWS Direct Connect which is located in the US?

- A. You can use a single AWS Direct Connect connection to build multi-region services.
- B. Any data transfer out of a remote region is billed at the location of your AWS Direct Connect data transfer rate.
- C. AWS Direct Connect locations in the United States can access public resources in any US region.
- D. To connect to a VPC in a remote region, you can use a virtual private network (VPN) connection over your public virtual interface.

Answer: B

Explanation:

Explanation

AWS Direct Connect locations in the United States can access public resources in any US region. You can use a single AWS Direct Connect connection to build multi-region services. To connect to a VPC in a remote region, you can use a virtual private network (VPN) connection over your public virtual interface.

To access public resources in a remote region, you must set up a public virtual interface and establish a border gateway protocol (BGP) session. Then your router learns the routes of the other AWS regions in the US. You can then also establish a VPN connection to your VPC in the remote region.

Any data transfer out of a remote region is billed at the remote region data transfer rate.
