Salesforce Certified MuleSoft Integration Foundations Sample Questions (Q51-Q56):

NEW QUESTION # 51

What are two reasons why a typical Mulesoft customer favors a Mulesoft-hosted Anypoint platform runtime plane over a customer-hosted runtime for its Mule application deployments?

- A. Increased application isolation
- B. Reduced time-to-market for the first application
- C. Increased application throughput
- D. Reduced application latency
- E. Reduced IT operations effort

Answer: B,E

Explanation:

MuleSoft-Hosted Runtime (CloudHub): This is an Integration Platform as a Service (iPaaS) model where MuleSoft manages the infrastructure.

Reduced IT Operations Effort (Option A): Because MuleSoft manages the physical servers, operating system updates, and patching, the customer's IT team does not need to maintain the hardware or VM infrastructure.

Reduced Time-to-Market (Option D): With a pre-configured environment ready for deployment, teams can deploy applications immediately without waiting for the provisioning of on-premises servers, load balancers, or network configurations.

NEW QUESTION # 52

What is a defining characteristic of an Integration-Platform-as-a-Service (iPaaS)?

- A. No-code
- B. Cloud-based
- C. On-premises
- D. Code-first

Answer: B

Explanation:

Definition of iPaaS: Gartner and MuleSoft define iPaaS (Integration Platform as a Service) as a suite of cloud services enabling the development, execution, and governance of integration flows connecting any combination of on-premises and cloud-based processes, services, applications, and data within individual or across multiple organizations.

The Key Characteristic: The "as a Service" suffix explicitly denotes a Cloud-based delivery model.

MuleSoft Context: CloudHub is the iPaaS component of the Anypoint Platform. It is a fully managed, multi-tenant, cloud-based integration platform where you deploy API implementations without managing the underlying hardware.

NEW QUESTION # 53

What is an advantage of using OAuth 2.0 client credentials and access tokens over only API keys for API authentication?

- A. If the client secret is compromised, the client credentials do not have to be reissued
- **B. If the access token is compromised, the client credentials do not have to be reissued**
- C. If the client ID is compromised, it can be exchanged for an API key
- D. If the access token is compromised, it can be exchanged for an API key

Answer: B

Explanation:

Security Mechanisms:

API Keys (Client ID/Secret): These are static, long-lived credentials. If a Client Secret is stolen, you must reset it, update the application code, and redeploy-a painful process.

OAuth 2.0 (Access Tokens): The client uses the ID/Secret to request a temporary Access Token (TTL of usually 15-60 minutes).

The Advantage: The API client sends the token (not the secret) in the header. If this token is intercepted/compromised, it will expire shortly. The attacker cannot generate new tokens without the original Client Secret. Therefore, the underlying credentials remain safe, and you do not need to reissue them.

NEW QUESTION # 54

An API client makes an HTTP request to an API gateway with an Accept header containing the value "application/json".

- A. status: healthy
- B. status('healthy')
- **C. {"status": "healthy"}**
- D. status>healthy</status>

Answer: C

Explanation:

Content Negotiation: The HTTP Accept header is used by the client to tell the server what media type (format) it expects in the response.

application/json: This MIME type explicitly requests JSON (JavaScript Object Notation).

Analyzing the Options:

(B) {"status": "healthy"} is valid JSON format (Key-Value pair wrapped in braces).

(C) status>healthy</status> is XML.

(A) is YAML or Plain Text.

NEW QUESTION # 55

A developer needs to discover which API specifications have been created within the organization before starting a new project.

- A. Runtime Manager
- **B. Anypoint Exchange**
- C. API Manager
- D. Object Store

Answer: B

Explanation:

4

Anypoint Exchange: This is the central repository and knowledge base of the Anypoint Platform. It is designed specifically for Discovery and Reuse. 6 The Workflow: Before building a new integration, a developer searches Exchange to see if an Asset (API Specification, Fragment, Connector, or Template) already exists. This prevents duplication of effort-a core tenet of the API-led connectivity approach.

Why others are incorrect:

Runtime Manager: Used for deploying and monitoring running applications.

API Manager: Used for applying policies and governing APIs, not primarily for discovery by developers.

Object Store: A mechanism for storing data/state within a Mule application.
