Response:

- A. Deploy PowerProtect Data Manager search engine.

NEW QUESTION # 70

What is a key factor in ensuring effective backup of VMs with PowerProtect Data Manager?

- A. VM 's network settings
- B. VM 's guest operating system
- **C. VM 's snapshot capability**
- D. VM 's hardware version

Answer: C

Explanation:

PowerProtect Data Manager 's virtual machine protection is built upon a foundation of snapshot-based technology using the VMware vStorage APIs for Data Protection (VADP).

* Snapshot Reliance: To perform an image-level backup, PPDM (via the VM Direct Engine) requests that VMware vCenter create a snapshot of the target VM. This freezes the virtual disks, allowing PPDM to read the data while the VM remains operational.

* VADP Integration: If a VM 's snapshot capability is compromised—for instance, due to existing broken snapshot chains, independent disks, or RDM (Raw Device Mapping) disks in physical mode—the backup will fail.

* CBT (Changed Block Tracking): Effective backups also rely on VMware 's CBT to identify only the blocks that have changed since the last backup. This is facilitated through the snapshot mechanism.

Without the ability to successfully create and manage snapshots, PPDM cannot perform a consistent image-level protection of the virtual asset.

NEW QUESTION # 73

An Oracle administrator is preparing an RMAN recovery script using PowerProtect Data Manager. What is the default installation location of the DD Boost library file?

- A. \$ORACLE_AGENT_HOME/lib
- **B. \$RMAN_AGENT_HOME/lib**
- C. \$RMAN_AGENT/lib
- D. \$ORACLE_HOME/lib

Answer: B

Explanation:

In Dell PowerProtect Data Manager (PPDM), protecting Oracle databases involves the use of the PowerProtect Data Manager Oracle RMAN agent. This agent facilitates the communication between the Oracle Recovery Manager (RMAN) and the PowerProtect DD (Data Domain) system.

* **The Library File:** To enable the RMAN " SBT_TAPE " device to communicate with the protection storage via the DD Boost protocol, a specific library file (usually libddobk.so on Linux or libddobk.dll on Windows) must be referenced in the RMAN script.

* **Path Variable:** During the installation of the RMAN agent, a set of environment variables is established. The root directory where the agent is installed is referred to as \$RMAN_AGENT_HOME (typically /opt/dpsapps/rmanagent on Linux).

* **Location:** The library files required for the RMAN configuration are stored in the lib subdirectory.

Therefore, the correct path to provide in the SBT_LIBRARY parameter of the RMAN script is \$RMAN_AGENT_HOME/lib.

Ensuring the correct path is used is vital for the RMAN channel allocation to succeed, allowing PPDM to manage the backup and recovery metadata while the data flows directly to the DD system.
