CrowdStrike Certified Cloud Specialist Sample Questions (Q144-Q149):

NEW QUESTION # 144
Which Fusion workflow trigger can be used to take an action when a vulnerability is found on one of your container images?

- A. Vulnerabilities user action > Vulnerabilities

- B. Kubernetes and containers > Container detections > Vulnerabilities
- C. Vulnerabilities user action > Host
- D. Kubernetes and containers > Image assessment > Vulnerabilities

Answer: D

Explanation:
To automate response actions when a vulnerability is discovered in a container image, CrowdStrike Falcon Fusion uses the triggerKubernetes and containers > Image assessment > Vulnerabilities. This trigger activates when Falcon identifies vulnerabilities during container image scanning and assessment.
Image assessment vulnerabilities occurpre-runtime, making this trigger ideal for shift-left security automation. Actions such as sending notifications, opening tickets, tagging images, or blocking deployments via policy enforcement can be automatically initiated before vulnerable images reach production.
TheContainer detectionstrigger applies to runtime events, not image vulnerabilities.Vulnerabilities user actiontriggers depend on manual interaction and are not suitable for automated detection-driven workflows.
By using the image assessment vulnerability trigger, organizations can integrate Falcon Cloud Security findings directly into CI/CD pipelines and remediation workflows, ensuring faster response and reduced risk exposure.
Therefore, the correct Fusion workflow trigger isKubernetes and containers > Image assessment > Vulnerabilities.

NEW QUESTION # 145
Which of the following steps is essential when configuring an automated remediation dry run in CrowdStrike Falcon?

- A. Integrate third-party tools for enhanced dry run reporting
- B. Enable enforcement mode to simulate real-world remediation
- C. Select a limited scope of affected resources to prevent wide-scale simulation
- D. Schedule the dry run to occur only during off-peak hours

Answer: C

Explanation:
Option A: While integration with third-party tools may enhance monitoring and reporting, it is not essential for performing a dry run. The primary goal of a dry run is to validate the workflow within the platform.
Option B: When performing a dry run, it is important to limit the scope of affected resources to ensure the simulation is manageable and does not inadvertently include unnecessary or unrelated areas. This allows for precise evaluation of the workflow's effectiveness and helps in identifying issues without impacting the overall environment.
Option C: While off-peak scheduling may reduce operational overhead, it is not an essential requirement for dry runs. The focus is on testing the workflow, regardless of the time it is run.
Option D: Enforcement mode is used for applying actual remediation actions, not for a dry run. A dry run avoids execution of real-world actions, focusing solely on simulation.

NEW QUESTION # 146
You are troubleshooting an issue with an Azure account registered in Falcon Cloud Security. The registration appeared to be successful but certain CSPM operations, including asset inventories and IOM detection, are failing.
How can you securely test the hypothesis that these failed CSPM operations are related to your firewall configuration?

- A. Check that you have allowlisted the IP addresses provided in the public-facing CrowdStrike documentation
- B. Temporarily open up the firewall to all inbound traffic for testing purposes
- C. Begin investigating another hypothesis as there is no way blocked traffic could be responsible

Answer: A

Explanation:
The secure and recommended approach to validate whether firewall restrictions are causing CSPM failures is toconfirm that CrowdStrike's documented IP addresses are allowlisted. Falcon Cloud Security relies on outbound API connectivity to cloud providers, and blocked traffic can disrupt asset inventory collection and IOM detection even if registration succeeds.
CrowdStrike publishes required IP ranges and endpoints for each cloud region. Verifying firewall rules against this documentation is alow-risk, best-practice troubleshooting stepthat preserves security controls while validating connectivity assumptions.
Opening firewalls broadly is insecure and unnecessary, and dismissing firewall-related causes without verification can delay resolution. Therefore, the correct answer isCheck that you have allowlisted the IP addresses provided in the public-facing

CrowdStrike documentation.

NEW QUESTION # 147
A company wants to create a Falcon Sensor policy to enforce strict monitoring on critical servers.
What is an essential configuration step for the policy?

- A. Configure prevention settings such as "Exploit Mitigation" and "Malware Prevention" for the policy.
- B. Add the policy under the "Sensor Exclusions" tab in the Falcon Console.
- C. Set the policy mode to "Detection Only" for all servers.
- D. Assign the policy to the "Default Group" to ensure global coverage.

Answer: A

Explanation:
Option A: Configuring prevention settings like "Exploit Mitigation" and "Malware Prevention" is critical to enhance security on servers. These settings help the Falcon Sensor proactively block threats and secure the system.
Option B: The "Sensor Exclusions" tab is for excluding specific files, paths, or processes from monitoring, not for creating or applying policies.
Option C: Assigning to the "Default Group" might lead to unintended policy application across non-critical systems. Policies should target specific groups for better control.
Option D: While "Detection Only" provides visibility, it does not actively prevent threats. For critical servers, enabling prevention is more appropriate to mitigate risks.

NEW QUESTION # 148
What is the primary step required to deprovision a cloud account from Falcon in the CrowdStrike platform?

- A. Revoke the API client credentials associated with the cloud account in the "API Clients and Keys" section.
- B. Disable the cloud account integration in the Falcon console under the "Cloud Accounts" tab.
- C. Delete the cloud account directly from the cloud provider's console to automatically deprovision it from Falcon.
- D. Remove all workloads and endpoints linked to the cloud account before attempting to deprovision it.

Answer: B

Explanation:
Option A: Although managing workloads and endpoints is a part of cloud security, their removal is not required for deprovisioning a cloud account in Falcon. This step is unnecessary and might lead to delays or errors in the deprovisioning process.
Option B: Revoking API client credentials is an optional step for enhanced security but does not directly deprovision the cloud account from Falcon. Deprovisioning must still occur through the
"Cloud Accounts" tab.
Option C: Deleting the account from the cloud provider's console does not automatically deprovision it from Falcon. This action would leave stale configurations in the Falcon platform, potentially leading to unnecessary alerts or security concerns.
Option D: Disabling the integration through the "Cloud Accounts" tab in the Falcon console is the correct way to deprovision a cloud account. This ensures that all configurations and permissions tied to the cloud account in the Falcon platform are properly removed.
It also prevents further communication between Falcon and the cloud provider. Neglecting to do this may leave unnecessary configurations or cause alerts from unused integrations.
