our experts have rewritten the textbooks according to the exam outline of DCA, and have gathered all the key difficulties and made key notes, so that you can review them in a centralized manner. Experts also conducted authoritative interpretations of all incomprehensible knowledge points through examples and other methods. The expressions used in DCA Learning Materials are very easy to understand. Even if you are an industry rookie, you can understand professional knowledge very easily. The DCA training torrent will be the best study guide for you to obtain your certification.

There is a high demand for Docker Development certification, therefore there is an increase in the number of Docker DCA exam candidates. Many resources are available on the internet to prepare for the Docker Certified Associate (DCA) Exam exam. RealVCE is one of the best certification exam preparation material providers where you can find newly released Docker DCA Dumps for your exam preparation. With years of experience in compiling top-notch relevant Docker DCA dumps questions, we also offer the Docker DCA practice test (online and offline) to help you get familiar with the actual exam environment.

## Reasons to Choose Web-Based Docker DCA Practice Exam

Over the past few years, we have gathered hundreds of industry experts, defeated countless difficulties, and finally formed a complete learning product - DCA test answers, which are tailor-made for students who want to obtain DCA certificates. Our customer service is available 24 hours a day. You can contact us by email or online at any time. In addition, all customer information for purchasing DCA Test Torrent will be kept strictly confidential. We will not disclose your privacy to any third party, nor will it be used for profit. Then, we will introduce our products in detail.

### Docker Certified Associate (DCA) Exam Sample Questions (Q188-Q193):

#### NEW QUESTION # 188

Which of the following is NOT backed up when performing a Docker Trusted backup operation?

- A. DTR configurations
- B. Repository metadata
- C. Access control to repos and images
- D. Image blobs

**Answer: D**

#### NEW QUESTION # 189

You created a new service named 'http' and discover it is not registering as healthy. Will this command enable you to view the list of historical tasks for this service?

Solution:'docker inspect http'

- A. Yes
- B. No

**Answer: B**

Explanation:

Explanation

= The 'docker inspect' command returns low-level information on Docker objects, such as containers, images, networks, etc. It does not show the list of historical tasks for a service. To view the list of tasks for a service, you need to use the 'docker service ps' command. For example, to see the tasks for the 'http' service, you would run 'docker service ps http'. This would show the ID, name, image, node, desired state, current state, and error of each task. References: Docker inspect | Docker Docs, Docker service ps | Docker Docs

#### NEW QUESTION # 190

Your organization has a centralized logging solution, such as Splunk.

Will this configure a Docker container to export container logs to the logging solution?

Solution. docker system events --filter splunk

- A. Yes
- B. No

**Answer: B**

Explanation:

The command docker system events --filter splunk will not configure a Docker container to export container logs to the logging solution. The command docker system events will display real-time events from the Docker daemon, such as container creation, start, stop, etc. The --filter option will filter the events by various criteria, such as type, label, name, etc. However, there is no filter for splunk, and even if there was, it would only show the events related to Splunk, not the container logs. To configure a Docker container to export container logs to Splunk, you need to use the Splunk logging driver, which is a plugin that sends container logs to HTTP Event Collector in Splunk Enterprise and Splunk Cloud. You can use the --log-driver and --log-opt options when creating or running a container to specify the Splunk logging driver and its options, such as the Splunk token, URL, source, sourcetype, index, etc. Alternatively, you can configure the Splunk logging driver as the default logging driver for the Docker daemon by setting the log-driver and log-opts keys in the daemon.json file and restarting Docker. #### NEW QUESTION # 191

An application image runs in multiple environments, and each environment uses different certificates and ports, what is the best practice to deploy the containers?

- A. Create images that contain the specific configuration for every environment.
- B. Create a Dockerfile for each environment, specifying ports and ENV variables for certificates.
- C. Create a Dockerfile for each environment, specifying ports and Docker secrets for certificates.
- **D. Create a config file for each environment.**

**Answer: D**

#### NEW QUESTION # 192

Two development teams in your organization use Kubernetes and want to deploy their applications while ensuring that Kubernetes-specific resources, such as secrets, are grouped together for each application.

Is this a way to accomplish this?

Solution. Create a collection for for each application.

- A. Yes
- **B. No**

**Answer: B**

Explanation:

Explanation

= Creating a collection for each application is not a way to accomplish this. A collection is a term used by Ansible to describe a package of related content that can be used to automate the management of Kubernetes resources<sup>1</sup>. A collection is not a native Kubernetes concept and does not group resources together within the cluster. To group Kubernetes-specific resources, such as secrets, for each application, you need to use namespaces. A namespace is a logical partition of the cluster that allows you to isolate resources and apply policies to them<sup>2</sup>. You can create a namespace for each application and store the secrets and other resources in that namespace. This way, you can prevent conflicts and limit access to the resources of each application. To create a namespace, you can use the `kubectl create namespace` command or a yaml file<sup>2</sup>. To create a secret within a namespace, you can use the `kubectl create secret` command with the `--namespace` option or a yaml file with the `metadata.namespace` field<sup>3</sup>. References:
