### Fortinet EMEA Advanced Support Exam Sample Questions (Q43-Q48):

#### NEW QUESTION # 43

Which of the below technology(ies) could reduce CPU load and memory utilization used by an IPS engine?

- A. Using regular instead of extended database, to reduce memory footprint
- B. Using multiple engines, aligned with load balancing technologies like Turbo that uses round robin algorithms to dispatch traffic up to specific IPS engine
- C. Using IPS sensors and IPS filter to determine which traffic should be examined for which signatures, instead of examine network traffic for all signatures
- D. IPS does not compare traffic to each signature individually. Instead it compiles them into a decision tree
- E. All of the above

Answer: A,C,D

Explanation:

IPS efficiency is improved by: A) Compiling signatures into a decision tree to reduce comparison overhead; B) Using IPS sensors/filters to selectively apply signatures to relevant traffic, reducing unnecessary processing; D) Using a regular database instead of an extended one to lower memory usage. Option C's

"Turbo" and round-robin load balancing is not a standard Fortinet IPS feature. Option E is incorrect as C is not valid. Exact extract: "IPS efficiency is improved by compiling signatures into decision trees to minimize CPU usage... IPS sensors and filters allow selective signature application to reduce processing... Using the regular signature database instead of extended reduces memory footprint."

#### NEW QUESTION # 44

Client is connected to firewall via link with MTU 1500 bytes, server is connected to firewall via link with MTU 1496 bytes. The firewall is rewriting both sender and receiver tcp-mss to 1450 bytes. What maximum size of IP packets are we going to see when client connects to server?

- A. 1500 bits
- B. 1496 bits
- C. 1500 bytes
- D. 1450 bits
- E. 1496 bytes
- F. 1450 bytes

**Answer: F**

Explanation:

The TCP MSS (Maximum Segment Size) defines the maximum TCP payload size, excluding headers. When the firewall sets MSS to 1450 bytes, the TCP segment size is limited to this value. For IP packets, the total size includes the TCP header (20 bytes) and IP header (20 bytes), so  $1450 \text{ (MSS)} + 20 \text{ (TCP)} + 20 \text{ (IP)} = 1490$  bytes, which fits within both link MTUs (1500 and 1496 bytes). Thus, the maximum IP packet size is not limited by the link MTUs but by the MSS, adjusted for headers. Options C and F (bits) are incorrect units; A and B exceed the MSS limit. Exact extract: "The TCP MSS is adjusted to prevent fragmentation... FortiGate can rewrite the MSS in TCP SYN packets to ensure the total IP packet size (including IP and TCP headers) does not exceed the configured value."

#### NEW QUESTION # 45

What happens when a FortiGate detects a SYN flood attack?

- A. It applies rate limiting to SYN packets
- B. It drops all incoming packets
- C. It redirects traffic to a backup gateway
- D. It enables proxy-based inspection

**Answer: A**

Explanation:

When FortiGate detects a SYN flood attack, it applies rate limiting to SYN packets via a DoS policy, dropping excessive packets to mitigate the attack. It does not drop all packets (A), enable proxy inspection (B), or redirect traffic (D). Exact extract: "FortiGate mitigates SYN flood attacks using DoS policies, which apply rate limiting to SYN packets to prevent overwhelming the system"

#### NEW QUESTION # 46

Which FortiGate feature allows inspection of encrypted SSL/TLS traffic?

- A. SSL Inspection
- B. Web Filtering
- C. Application Control
- D. Deep Packet Inspection

**Answer: A**

Explanation:

FortiGate's SSL Inspection feature decrypts and inspects SSL/TLS traffic to detect threats or enforce policies, using techniques like full SSL inspection or certificate inspection. Deep Packet Inspection (A) is a broader term, Application Control (C) identifies apps, and Web Filtering (D) blocks URLs, not specific to SSL. Exact extract: "SSL Inspection allows FortiGate to decrypt and inspect SSL/TLS traffic to detect hidden threats or enforce security policies, supporting full or certificate-based inspection."

#### NEW QUESTION # 47

How does a stateful firewall control a TCP session?

- A. TCP destination ports are used to control the session
- B. TCP ack numbers are used to control the session
- C. TCP source ports are used to control the session
- **D. TCP sequence numbers and TCP flags are used to control the session**

**Answer: D**

Explanation:

A stateful firewall, like FortiGate, tracks TCP sessions by maintaining a state table that includes TCP sequence numbers and flags (e.g., SYN, ACK, FIN) to monitor the connection's lifecycle (establishment, data transfer, termination). This ensures proper session handling, detecting out-of-order packets or invalid states.

Source and destination ports identify the session but don't control its state, and ACK numbers alone are insufficient. Exact extract: "Stateful inspection tracks TCP sessions using sequence numbers and TCP flags (SYN, ACK, FIN, etc.) to ensure packets are valid and part of an established session... FortiGate maintains a state table to monitor the TCP connection states."
