# CrowdStrike CCCS-203b Reliable Test Voucher & Exam CCCS-203b Practice

CCCS-203b exam and they all got help from real and updated CrowdStrike CCCS-203b exam questions. You can also be the next successful candidate for the CCCS-203b certification exam. No doubt the CrowdStrike CCCS-203b Certification Exam is one of the most difficult CrowdStrike certification exams in the modern CrowdStrike world. This CCCS-203b exam always gives a tough time to their candidates.

Our CCCS-203b training prep was produced by many experts, and the content was very rich. At the same time, the experts constantly updated the contents of the study materials according to the changes in the society. The content of our CCCS-203b study guide is definitely the most abundant. Before you go to the exam, our CCCS-203b Exam Questions can provide you with the simulating exam environment. This not only includes the examination process, but more importantly, the specific content of the exam. In previous years' examinations, the hit rate of CCCS-203b learning quiz was far ahead in the industry.

So we are looking forward to establishing a win-win relation with you by our CCCS-203b training engine. In our trade with merchants of various countries, we always adhere to the principles of mutual benefits rather than focusing solely on our interests on the CCCS-203b Exam Questions. So our aim is to help our customers to pass the CCCS-203b exam as easy as possible. We have invested a lot on the compiling the content of the CCCS-203b study materials and want to be the best.

CrowdStrike Certified Cloud Specialist - 2025 Version Sample Questions (Q10-Q15):

NEW QUESTION # 10
Which of the following best describes the primary function of CrowdStrike's Cloud Infrastructure Entitlement Manager (CIEM)/Identity Analyzer?

- A. Detecting excessive permissions and minimizing cloud identity risks.
- B. Providing endpoint protection for virtual machines in the cloud.
- C. Encrypting data stored in cloud object storage services.
- D. Monitoring network traffic for signs of unauthorized access.

Answer: A

Explanation:

Option A: Encryption is a data protection task handled by tools such as AWS KMS or Azure Key Vault, not CIEM. Misinterpreting CIEM as a data encryption tool is a common misconception.

Option B: Endpoint protection is handled by solutions like CrowdStrike Falcon, not CIEM. CIEM focuses exclusively on identity and access management.

Option C: While important for cloud security, this is primarily the role of cloud network monitoring tools or firewalls, not CIEM, which focuses on identity and permissions.

Option D: CIEM/Identity Analyzer specializes in identifying excessive, unused, or misconfigured permissions across cloud environments, helping organizations enforce the principle of least privilege. This is critical for reducing the risk of insider threats and accidental exposures. Many users confuse this functionality with broader cloud security tools, but CIEM's focus is on identity and access governance.

NEW QUESTION # 11

What is the most appropriate first step when creating a Falcon Fusion workflow to notify individuals about automated remediation actions?

- A. Add a conditional step to verify if the action is approved by an administrator.
- B. Manually send an email notification to the security team.
- C. Set up a trigger event for the workflow, such as a detection in the Falcon platform.
- D. Create a custom dashboard to visualize all remediation events.

Answer: C

Explanation:

Option A: The first step in creating a Falcon Fusion workflow is to define the trigger event that initiates the workflow. This could be a specific detection type or another event in the Falcon platform. Without a trigger, the workflow has no starting point. This step ensures that the workflow activates only in response to the desired conditions.

Option B: While notifying the security team is important, manually sending emails defeats the purpose of automating workflows with Falcon Fusion. Automation is designed to streamline the response process and reduce human intervention.

Option C: Adding conditional steps for approval might be part of the workflow, but it is not the first step. Conditional logic is applied after the workflow is triggered. Focusing on triggers first is essential.

Option D: While dashboards are useful for monitoring, they are not part of creating workflows. Dashboards visualize outcomes, whereas workflows focus on defining triggers and actions.

NEW QUESTION # 12

What is a key benefit of Falcon Cloud Security's integration of its components within a single platform?

- A. It eliminates the need for traditional SIEM tools by storing all security logs in the Falcon platform.
- B. It provides a built-in firewall to secure cloud environments against external attacks.
- C. It allows for seamless encryption of all cloud data, ensuring compliance with GDPR and CCPA.
- D. It reduces the need for manual threat analysis by leveraging AI-powered threat detection and response.

Answer: D

Explanation:

Option A: While encryption is a critical aspect of cloud security, Falcon Cloud Security does not perform data encryption. Instead, it provides unified visibility, detection, and protection across cloud workloads and environments.

Option B: Falcon Cloud Security integrates with SIEM tools to enhance security operations but does not replace them entirely. It collects telemetry and threat data, which can be shared with SIEM solutions for deeper analysis.

Option C: Falcon Cloud Security integrates AI and machine learning to automate threat detection and response, reducing the manual workload for security teams. This is a primary benefit of its unified platform approach.

Option D: Falcon Cloud Security is not a firewall. Instead, it focuses on endpoint protection, workload security, and threat detection, which complement network-based tools like firewalls.

NEW QUESTION # 13

An organization uses a private container registry protected by strict access controls. To enable CrowdStrike to perform image assessment, what must the organization do?

- A. Add all container registry IP addresses to the CrowdStrike allowlist.
- B. Grant CrowdStrike full administrative access to the container registry.
- C. Add CrowdStrike's IP addresses to the registry's allowlist to enable access.
- D. Configure CrowdStrike to scan images only after they are deployed.

Answer: C

Explanation:
Option A: For CrowdStrike to assess images in a private registry, it needs network access to the registry. Adding CrowdStrike's IP addresses to the allowlist ensures that its traffic isn't blocked by access controls, enabling effective scanning while maintaining security.
Option B: CrowdStrike doesn't require administrative access to the registry. It only needs permission to scan images, granted through the allowlisting of its IP addresses. Providing administrative access introduces unnecessary security risks.
Option C: Allowlisting all registry IPs in CrowdStrike is unnecessary and could create security vulnerabilities. The proper approach is to allowlist CrowdStrike's IPs in the registry, not the reverse.
Option D: Scanning images post-deployment introduces security risks. CrowdStrike's design emphasizes scanning images pre-deployment to detect vulnerabilities before they are introduced into the environment.

NEW QUESTION # 14
What is a key requirement for deploying the CrowdStrike Kubernetes Admission Controller to monitor and secure Kubernetes workloads?

- A. The Admission Controller requires a dedicated namespace in the Kubernetes cluster.
- B. The Admission Controller requires the Mutating Admission Webhook configuration to be enabled in the Kubernetes API server.
- C. The Admission Controller must run with root-level permissions inside a privileged container.
- D. The Admission Controller must be deployed as a DaemonSet on every node.

Answer: B

Explanation:
Option A: The CrowdStrike Kubernetes Admission Controller uses the Mutating Admission Webhook to intercept and modify requests to the Kubernetes API server. This webhook allows the controller to enforce security policies and inject the required sensor configurations into pods at creation time. Ensuring the Mutating Admission Webhook configuration is enabled is a critical setup step for proper functionality.
Option B: The Admission Controller does not require root-level or privileged permissions. It relies on webhook functionality to perform its operations and does not interact directly with host-level resources.
Option C: While namespaces are often used for logical organization, the Admission Controller does not necessarily require a dedicated namespace. It can be deployed in any namespace, depending on the user's configuration preferences.
Option D: The Admission Controller is not deployed as a DaemonSet; instead, it operates as a webhook server integrated with the Kubernetes API server. DaemonSets are typically used for agents that need to run on every node, such as logging or monitoring tools.
