

BIG-IP Administration Data Plane Configuration training vce pdf & F5CAB3 latest practice questions & BIG-IP Administration Data Plane Configuration actual test torrent

“There is no royal road to learning.” Learning in the eyes of most people is a difficult thing. People are often not motivated and but have a fear of learning. However, the arrival of F5CAB3 study materials will make you no longer afraid of learning. F5CAB3 study material provides you with a brand-new learning method that lets you get rid of heavy schoolbags, lose boring textbooks, and let you master all the important knowledge in the process of making a question. Please believe that with F5CAB3 Study Materials, you will fall in love with learning.

With the development of the electronic equipment, there are a lot of changes in the designs of our F5CAB3 pass-sure torrent. The most impressive version is the APP online version. Normally, it can be used on all kinds of digital devices. But it also has the special advantage that the online version can be used when you are not online, As long as you use it for the first time in a networked environment, you can use the online version of our F5CAB3 learning guide from anywhere without network connection. I believe the online version of our F5CAB3 exam questions will be a good choice for you

>> New F5CAB3 Dumps Book <<

2026 Professional New F5CAB3 Dumps Book | BIG-IP Administration Data Plane Configuration 100% Free Latest Demo

As you can see on our website, there are versions of the PDF, Software and APP online. PDF version of our F5CAB3 study materials- it is legible to read and remember, and support customers' printing request. Software version of our F5CAB3 exam questions-It support simulation test system and times of setup has no restriction. Remember this version support Windows system users only. App online version of F5CAB3 Practice Engine -Be suitable to all kinds of equipment or digital devices.

F5 BIG-IP Administration Data Plane Configuration Sample Questions (Q60-Q65):

NEW QUESTION # 60

A Standard Virtual Server for a web application is configured with SNAT Automap. The original client IP must be known by backend servers.

What should the BIG-IP Administrator configure?

- A. Performance (HTTP) Virtual Server
- B. HTTP profile with X-Forwarded-For
- C. SNAT pool using client IP
- D. HTTP Transparent profile

Answer: B

Explanation:

X-Forwarded-For inserts the original client IP into HTTP headers while SNAT is enabled.

NEW QUESTION # 61

Refer to the exhibit.

A BIG-IP Administrator needs to configure health monitors for a newly configured server pool named Pool_B. Which health monitor settings will ensure that all pool members will be accurately marked as available or unavailable?

- A. HTTPS and HTTP with the Availability Requirement of at least one health monitor
- B. HTTPS, HTTP, FTP, and ICMP, with the Availability Requirement of all health monitors
- C. HTTPS, HTTP, FTP, and SSH with the Availability Requirement of all health monitors
- **D. HTTPS, HTTP, FTP, and SSH, with the Availability Requirement of at least one monitor**

Answer: D

Explanation:

The pool member list in the exhibit shows servers listening on four distinct service ports: 80 (HTTP), 21 (FTP), 443 (HTTPS), and 22 (SSH). To accurately monitor a pool where members provide different services, the administrator must apply monitors that correspond to each of those specific services.

The key to this configuration is the Availability Requirement (also known as "Monitor Rule"). If the administrator sets the requirement to "All health monitors," every single monitor (HTTP, HTTPS, FTP, and SSH) must pass for a member to be marked "Up." This would cause an immediate failure: for example, a server listening only on port 80 would fail the HTTPS, FTP, and SSH checks, resulting in the member being marked "Down" even if the HTTP service is healthy.

To ensure accuracy, the administrator should apply all four relevant monitors and set the Availability Requirement to at least one monitor. With this setting, the BIG-IP marks a member as "Up" if any of the assigned monitors return a successful response.

Therefore, the member at 10.200.50.210:80 will stay "Up" as long as the HTTP monitor passes, even though it fails the FTP, HTTPS, and SSH monitors. This configuration allows a single pool to contain diverse service types while ensuring that the specific port defined for each member is verified correctly. Option C is incorrect because ICMP only checks if the IP is alive, not if the specific service port is functioning.

NEW QUESTION # 62

All pool members are online and all other settings are default.

What might alter the load balancing behavior?

- A. Enabling an HTTP fallback host
- **B. Adding a persistence profile**
- C. Adding a OneConnect profile
- D. Enabling SNAT Automap

Answer: B

Explanation:

Persistence overrides load balancing decisions by maintaining client-to-server affinity.

NEW QUESTION # 63

A Standard Virtual Server for a web application is configured with Automap for the Source Address Translation option. The original source address of the client must be known by the backend servers. What should the BIG-IP Administrator configure to meet this requirement?

- A. An HTTP Transparent profile
- **B. An HTTP profile to insert the X-Forward-For header**
- C. The Virtual Server type as Performance (HTTP)
- D. A SNAT Pool with the client IP

Answer: B

Explanation:

SNAT Automap is a common configuration that replaces the client's original source IP address with one of the BIG-IP's self IP

addresses. This ensures that the backend servers send return traffic back through the BIG-IP, which is necessary for the ADC to process the traffic correctly. However, a side effect of SNAT is that the backend servers only see the BIG-IP's IP in their logs, losing visibility into the true identity of the client.

To resolve this while still using SNAT for routing purposes, the administrator must configure the BIG-IP to "pass" the client's IP address at the application layer. This is achieved by using an HTTP Profile with the Insert X-Forwarded-For setting enabled. When this profile is applied to the Virtual Server, the BIG-IP intercepts the HTTP request, adds a header (X-Forwarded-For) containing the client's original IP, and then forwards the modified request to the server. The backend web server can then be configured to read this header and log the original client IP instead of the BIG-IP's SNAT address.

Other options are incorrect for this requirement. Performance (HTTP) (Option A) is a virtual server type optimized for speed but often lacks the full Layer 7 header manipulation capabilities of a Standard Virtual Server. SNAT Pool with the client IP (Option C) is technically impossible as SNAT pools use static, pre-defined IPs. There is no such thing as an HTTP Transparent profile (Option D) in standard BIG-IP administration for this purpose. The X-Forwarded-For header insertion within the HTTP profile is the standard procedural method for maintaining client visibility in SNAT-enabled environments.

NEW QUESTION # 64

An LTM device has a virtual server mapped to www.f5.com with a pool assigned. The objects are defined as follows: Virtual server: Destination 192.168.245.100:443 netmask 255.255.255.0. Persistence: Source address persistence netmask 255.0.0.0. SNAT: Automap. Profiles: HTTP/TCP. How should the BIG-IP Administrator modify the persistence profile so that each unique IP address creates a persistence record?

- A. netmask 255.255.0.0
- B. netmask 0.0.0.0
- C. netmask 255.255.255.0
- D. netmask 255.255.255.255

Answer: D

Explanation:

Source Address Affinity (Persistence) works by tracking the source IP address of incoming packets to ensure a client stays connected to the same backend server. The "netmask" setting within the persistence profile determines the "granularity" of this tracking. A netmask tells the BIG-IP how many bits of the source IP address to ignore when creating the persistence record. For example, the current setting of 255.0.0.0 (a /8 mask) means the BIG-IP only looks at the first octet of the IP; this results in all users from the same large Class A network (e.g., everyone from 10.0.0.0 to 10.255.255.255) being persisted to the exact same server, which can lead to severe load imbalance.

To ensure that each unique IP address creates its own individual persistence record, the administrator must set the netmask to 255.255.255.255 (for IPv4). This is a "host mask" or /32, which instructs the BIG-IP to evaluate all 32 bits of the client's source IP address. With this setting, 10.1.1.1 and 10.1.1.2 will be treated as distinct entities and can be load balanced to different servers, each maintaining their own "stickiness". While Option A (255.255.255.0) would group users by their local subnet, only the full 255.255.255.255 mask satisfies the requirement for true unique-IP persistence. This configuration is standard for internet-facing applications where users arrive from diverse locations and the administrator wants to maintain the most granular and balanced distribution of traffic possible.

NEW QUESTION # 65

.....

Improving your efficiency and saving your time has always been the goal of our F5CAB3 preparation exam. If you are willing to try our F5CAB3 study materials, we believe you will not regret your choice. With our F5CAB3 Practice Engine for 20 to 30 hours, we can claim that you will be quite confident to attend your exam and pass it for sure for we have a high pass rate as 98% to 100% which is unmatched in the market.
