Salesforce Plat-Dev-301 Reliable Exam Blueprint: Salesforce Certified Platform Developer II - Multiple Choice - Pass4Leader Best Provider

Obtaining this Plat-Dev-301 certificate is not an easy task, especially for those who are busy every day. However, if you use our Plat-Dev-301 exam torrent, we will provide you with a comprehensive service to overcome your difficulties and effectively improve your ability. If you can take the time to learn about our Plat-Dev-301 Quiz prep, I believe you will be interested in our Plat-Dev-301 exam questions. Our Plat-Dev-301 learning materials are practically tested, choosing our Plat-Dev-301 exam guide, you will get unexpected surprise.

Salesforce Certified Platform Developer II - Multiple Choice Sample

Questions (Q139-Q144):

NEW QUESTION # 139

Universal Containers decided to use Salesforce to manage a new hire interview process. A custom object called Candidate was created with organization-wide defaults set to Private. A lookup on the Candidate object sets an employee as an Interviewer. What should be used to automatically give Read access to the record when the lookup field is set to the Interviewer user?

- A. The record can be shared using an Apex class.
- **B. The record can be shared using a sharing rule.**
- C. The record cannot be shared with the current setup.
- D. The record can be shared using a permission set.

Answer: B

Explanation:

A sharing rule can be used to automatically give Read access to a user specified in a lookup field. Sharing rules are declarative and can be based on criteria such as the value of a lookup field. This can be done without writing code and is maintainable through the Salesforce UI.

NEW QUESTION # 140

A developer wrote a trigger on Opportunity that will update a custom Last Sold Date field on the Opportunity's Account whenever an Opportunity is closed. In the test class for the trigger, the assertion to validate the Last Sold Date field fails. What might be causing the failed assertion?

- A. The test class has not implemented `seeAllData=true` in the test method.
- B. The test class has not defined an Account owner when inserting the test data.
- C. The test class is not using `System.runs()` to run tests as a Salesforce administrator.
- **D. The test class has not re-queried the Account record after updating the Opportunity.**

Answer: D

Explanation:

The test class may not be re-querying the Account record after updating the Opportunity, which is necessary to verify the updated field values. If the test does not query the database to get the most recent data after the trigger runs, it will not see the changes made by the trigger.

NEW QUESTION # 141

A company notices that their unit tests in a test class with many methods to create many records for prerequisite reference data are slow.

What can a developer do to address the issue?

- A. Move the prerequisite reference data setup to a `TestDataFactory` and call that from each test method.
- B. Turn off triggers, flows, and validations when running tests.
- **C. Move the prerequisite reference data setup to a `@testSetup` method in the test class.**
- D. Move the prerequisite reference data setup to the constructor for the test class.

Answer: C

Explanation:

`@testSetup` method improves test performance. It allows data sharing across test methods within a class, reducing redundant data creation.

NEW QUESTION # 142

A company has a Lightning page with many Lightning Components, some that cache reference data. It is reported that the page does not always show the most current reference data.

What can a developer use to analyze and diagnose the problem in the Lightning page?

- A. Salesforce Lightning Inspector Event Log tab

- B. Salesforce Lightning Inspector Transactions tab
- **C. Salesforce Lightning Inspector Storage tab**
- D. Salesforce Lightning Inspector Actions tab

Answer: C

Explanation:

The Storage tab in the Salesforce Lightning Inspector can be used to view and manage data stored on the client side, such as in the cache. This is useful for diagnosing issues related to stale or outdated cache data that may prevent the most current reference data from displaying.

NEW QUESTION # 143

An Apex class does not achieve expected code coverage. The testsetup method explicitly calls a method in the Apex class.. How can the developer generate the code coverage?

- **A. Add @testvisible to the method in the class the developer is testing.**
- B. Use system.assert() in testSetup to verify the values are being returned.
- C. Verify the user has permissions passing a user into System.runs().
- D. Call the Apex class method from a testsetup Instead of the testsetup method.

Answer: A

Explanation:

When an Apex class does not achieve the expected code coverage, it suggests that the test methods are not executing parts of the class. The @testvisible annotation can be used to increase code coverage by allowing test methods to access private or protected members of another class. This enables the test method to call methods that may not be directly accessible, but it is not a direct means to generate code coverage. The code coverage is actually achieved when the test methods execute the code within these methods. Therefore, to properly generate code coverage, the developer must ensure that the test methods call the relevant portions of the code that need to be covered. The use of @testvisible can facilitate this process by making otherwise inaccessible code available for testing.
