CrowdStrike IDP認定試験に対する効率のあがる勉強法

人生は勝ち負けじゃない、負けたって言わない人が勝ちなのよ。近年CrowdStrike IDP認定試験の難度で大方の受験生は試験に合格しなかったのに面して、勇者のようにこのチャレンジをやってますか。それで、我々社のCrowdStrike IDP無料の試験問題集サンプルを参考します。自分の相応しい復習問題集バージョン（PDF版、ソフト版を、オンライン版）を選んで、ただ学習教材を勉強し、正確の答えを覚えるだけ、CrowdStrike IDP資格認定試験に一度で合格できます。

CrowdStrike Certified Identity Specialist(CCIS) Exam 認定 IDP 試験問題 (Q25-Q30):

質問 # 25

Which of the following are minimum requirements for showing the Falcon Identity Verification Dialog on the end user's machine?

- A. Windows Server 2008 and PowerShell 5.1
- **B. Internet Explorer 9 and Windows Server 2008**
- C. .NET 3.5 and PowerShell 5.1
- D. Windows Vista and .NET 3.5

正解: B

解説:

The Falcon Identity Verification Dialog is used to prompt users for identity verification during conditional access enforcement. According to the CCIS curriculum, Internet Explorer 9 and Windows Server 2008 represent the minimum supported requirements for rendering the Identity Verification Dialog on an end user's system.

This requirement exists because the dialog relies on supported browser and OS components to present authentication challenges.

reliably during enforcement workflows. Systems that do not meet these minimum requirements may fail to display the dialog correctly, impacting the enforcement of MFA or identity verification actions.

The other options reference runtime frameworks or PowerShell versions that are not directly responsible for rendering the verification dialog. Therefore, Option A is the correct and verified answer.

質問 # 26

Which of the following BEST indicates that this user has an established baseline?

- A. The user has a risk score of 6.4
- B. The user has recent logon activity on ETIS-WS03
- C. The user was found logging into five endpoints
- D. The user has endpoints that they are considered owners of

正解: D

解説:

In Falcon Identity Protection, a user baseline is established by observing consistent and repeatable behavior over time, including authentication patterns, endpoint associations, and usage context. According to the CCIS curriculum, one of the strongest indicators that a user has an established baseline is the presence of endpoints for which the user is identified as an owner.

Endpoint ownership is determined through historical authentication behavior and usage frequency. When Falcon identifies that a user consistently logs into specific endpoints over time, those endpoints are marked as owned, which signifies that sufficient historical data exists to confidently model the user's normal behavior.

This ownership relationship is only created after Falcon has observed the user long enough to establish a reliable baseline.

The other options do not definitively indicate a baseline:

* Logging into multiple endpoints may occur during initial discovery or anomalous activity.

* A risk score reflects current risk posture, not baseline maturity.

* Recent logon activity alone does not imply historical consistency.

Because endpoint ownership requires sustained, predictable behavior over time, it is the clearest indicator that Falcon has successfully established a user baseline. Therefore, Option B is the correct and verified answer.

質問 # 27

An account without a phone number, operating system, or role of CEO would typically be defined as:

- A. Programmatic
- B. Human
- C. Enterprise
- D. Corporate

正解: A

解説:

Falcon Identity Protection classifies accounts based on observed authentication behavior and associated identity attributes, not solely on naming conventions. According to the CCIS curriculum, programmatic accounts (such as service accounts or application accounts) typically lack human-centric attributes like a phone number, assigned operating system, job title, or executive role (for example, CEO).

Human accounts generally have enriched identity context sourced from directory services and identity providers, including user profile details, interactive login behavior, and endpoint associations. In contrast, programmatic accounts authenticate non-interactively, often on predictable schedules, and do not require personal attributes to function.

Falcon analyzes authentication traffic to automatically identify these characteristics and classify the account accordingly. An account missing human identity signals—such as a phone number or endpoint ownership—strongly aligns with programmatic behavior.

Because the absence of personal attributes and interactive context is a defining indicator of a programmatic account, Option A is the correct and verified answer.

質問 # 28

Which option can be selected from the Threat Hunter menu to open the current Threat Hunter query in a new window as Graph API format?

- A. Open Query in API Builder
- B. Export to API Builder
- C. Save as Custom Report
- D. Save as Custom Query

正解: A

解説:

Falcon Threat Hunter provides a direct integration with the API Builder to support advanced investigation workflows and automation. According to the CCIS curriculum, analysts can take an existing Threat Hunter query and convert it into a GraphQL-compatible format by selecting Open Query in API Builder from the Threat Hunter menu.

This option opens the current query in a new window within API Builder, automatically translating the query structure into GraphQL syntax where applicable. This enables security teams to reuse validated hunting logic for automation, reporting, or external integrations without rewriting queries from scratch.

The other menu options serve different purposes:

- * Export to API Builder is not a valid menu action.
- * Save as Custom Query stores the query for reuse inside Threat Hunter.
- * Save as Custom Report generates a reporting artifact, not an API query.

Because Open Query in API Builder is the only option that opens the query in GraphQL format in a new window, Option D is the correct and verified answer.

質問 # 29

The configuration of the Azure AD (Entra ID) Identity-as-a-Service connector requires which three pieces of information?

- A. Tenant Domain, Token, Configuration File
- B. Tenant Domain, Client Secret, User Identifier
- C. Tenant Domain, Application ID, Application Secret
- D. Tenant Domain, Application ID, Scope

正解: C

解説:

To integrate Falcon Identity Protection with Azure AD (Entra ID) as an Identity-as-a-Service (IDaaS) provider, specific application-level credentials are required. According to the CCIS curriculum, the connector configuration requires Tenant Domain, Application (Client) ID, and Application Secret.

These values are generated when registering an application in Azure AD and are used to authenticate Falcon Identity Protection securely via OAuth-based API access. This method ensures least-privilege access and allows the connector to ingest cloud authentication activity and apply SSO-related policy enforcement.

Other options list incomplete or incorrect credential combinations. Therefore, Option D is the correct and verified answer.

質問 # 30
