Based on the partial outputs displayed, which devices can be members of a FortiAnalyzer Fabric?

- A. All devices listed can be members.
- B. FortiAnalyzer2 and FortiAnalyzer3
- C. FortiAnalyzer1 and FortiAnalyzer2
- D. FortiAnalyzer1 and FortiAnalyzer3

Answer: A

Explanation:

In a FortiAnalyzer Fabric, devices can participate in a cluster or grouping if they meet specific compatibility criteria. Based on the outputs provided, let's evaluate these criteria:

* Version Compatibility:

* All three devices, FortiAnalyzer1, FortiAnalyzer2, and FortiAnalyzer3, are running version v7.

4.1-build0238, which is the same across the board. This version alignment is crucial because FortiAnalyzer Fabric requires that devices run compatible firmware versions for seamless communication and management.

* Platform Type and Configuration:

* All three devices are configured as Standalone in the HA mode, which allows them to operate independently but does not restrict their participation in a FortiAnalyzer Fabric. Each device is also on the FAZVM64-KVM platform type, ensuring hardware compatibility.

* Global Settings:

* Key settings such as adm-mode, adm-status, and adom-mode are consistent across all devices (adm-mode: normal, adm-status: enable, adom-mode: normal), which aligns with requirements for fabric integration and role assignment flexibility.

* Each device also has the log-forward-cache-size set, which is relevant for forwarding logs within a fabric environment.

Based on the above analysis, all devices (FortiAnalyzer1, FortiAnalyzer2, and FortiAnalyzer3) meet the requirements to be part of a FortiAnalyzer Fabric.

* FortiAnalyzer 7.4.1 documentation outlines that devices within a FortiAnalyzer Fabric should be on the same or compatible firmware versions and hardware platforms, and they must be configured for integration.

Given that all devices match the version, platform, and mode criteria, they can all be part of the FortiAnalyzer Fabric.

NEW QUESTION # 58

A playbook contains five tasks in total. An administrator runs the playbook and four out of five tasks finish successfully, but one task fails.

What will be the status of the playbook after it is run?

- A. Failed
- B. Attention required

- C. Success
- D. Upstream_failed

Answer: A

Explanation:

Playbook jobs that include one or more failed tasks are labeled as Failed in Playbook Monitor. A failed status, however, does not mean that all tasks failed. Some individual actions may have completed successfully.

NEW QUESTION # 59

It is a best practice to upload FortiAnalyzer local logs to a remote server. Which three remote servers are supported for the upload? (Choose three.)

- A. SCP
- B. TCP
- C. FTP
- D. UDP
- E. SFTP

Answer: A,C,E

NEW QUESTION # 60

In your role as an analyst, you frequently search the log view using the same parameters. Instead of defining the same search filters repeatedly, what can you do to save time?

- A. Configure a custom view.
- B. Configure a custom dashboard.
- C. Configure a report template.
- D. Configure a chart template and apply it to device groups.

Answer: A

Explanation:

In FortiAnalyzer, a custom view allows you to save frequently used search filters and parameters in Log View. This enables you to quickly reuse the same search criteria without redefining the filters each time, saving significant time during log analysis.

NEW QUESTION # 61

Refer to the exhibit with partial output:

```

Your colleague exported a playbook and has sent it to you for review. You open the file in a text editor and observe the output as shown in the exhibit.

Which statement about the export is true?

- A. The option to include the connector was not selected.
- B. The export data type is zipped.
- C. The playbook is misconfigured.
- D. Your colleague put a password on the export.

Answer: B

Explanation:

In the exhibit, the data structure shows a checksum field and a data field with a long, seemingly encoded string. This format is indicative of a file that has been compressed or encoded for storage and transfer.

Export Data Type:

The data field is likely a base64-encoded string, which is commonly used to represent binary data in text format. Base64 encoding is often applied to data that has been compressed (zipped) for easier handling and transfer. The checksum field, with an MD5 hash, provides a way to verify the integrity of the data after decompression.
