With limited time for your preparation, many exam candidates can speed up your pace of making progress. Our N10-009 study materials will remedy your faults of knowledge understanding. As we know, some people failed the exam before, and lost confidence in this agonizing exam before purchasing our N10-009 training guide. Also it is good for releasing pressure. Many customers get manifest improvement and lighten their load with our N10-009 exam braindumps. So just come and have a try!

CompTIA Network+ Certification Exam Sample Questions (Q95-Q100):

NEW QUESTION # 95

Which of the following are environmental factors that should be considered when installing equipment in a building? (Select two).

- **A. Fire suppression system**
- B. Floor construction type
- C. UPS location
- D. Proximity to nearest MDF
- E. Humidity control
- F. Power load

Answer: A

Explanation:

When installing equipment in a building, environmental factors are critical to ensure the safety and longevity of the equipment. A fire suppression system is essential to protect the equipment from fire hazards. Humidity control is crucial to prevent moisture-related damage, such as corrosion and short circuits, which can adversely affect electronic components. Both factors are vital for maintaining an optimal environment for networking equipment. Reference: CompTIA Network+ study materials.

NEW QUESTION # 96

Voice traffic is experiencing excessive jitter. A network engineer wants to improve call performance and clarity. Which of the following features should the engineer configure?

- **A. QoS**
- B. STP

Answer: A

Explanation:

Quality of Service (QoS) prioritizes delay-sensitive traffic such as VoIP by assigning higher priority in queues, reducing jitter, latency, and packet loss. Implementing QoS policies ensures stable and clear voice communication.

B . STP (Spanning Tree Protocol) prevents switching loops, but it does not address jitter or real-time traffic performance.

NEW QUESTION # 97

A network administrator wants to implement security zones in the corporate network to control access to only individuals inside of the corporation. Which of the following security zones is the best solution?

- A. Extranet
- **B. Trusted**
- C. Public
- D. VPN

Answer: B

Explanation:

Introduction to Security Zones:

Security zones are logical segments within a network designed to enforce security policies and control access. They help in segregating and securing different parts of the network.

Types of Security Zones:

Trusted Zone: This is the most secure zone, typically used for internal corporate networks where only trusted users have access.

Extranet: This zone allows controlled access to external partners, vendors, or customers.

VPN (Virtual Private Network): While VPNs are used to create secure connections over the internet, they are not a security zone themselves.

Public Zone: This zone is the least secure and is typically used for public-facing services accessible by anyone.

Trusted Zone Implementation:

The trusted zone is configured to include internal corporate users and resources. Access controls, firewalls, and other security measures ensure that only authorized personnel can access this zone.

Internal network segments, such as the finance department, HR, and other critical functions, are usually placed in the trusted zone.

Example Configuration:

Firewall Rules: Set up rules to allow traffic only from internal IP addresses.

Access Control Lists (ACLs): Implement ACLs on routers and switches to restrict access based on IP addresses and other criteria.

Segmentation: Use VLANs and subnetting to segment and isolate the trusted zone from other zones.

Explanation of the Options:

A . Extranet: Suitable for external partners, not for internal-only access.

B . Trusted: The correct answer, as it provides controlled access to internal corporate users.

C . VPN: A method for secure remote access, not a security zone itself.

D . Public: Suitable for public access, not for internal corporate users.

Conclusion:

Implementing a trusted zone is the best solution for controlling access within a corporate network. It ensures that only trusted internal users can access sensitive resources, enhancing network security.

NEW QUESTION # 98

Which of the following attacks would most likely cause duplicate IP addresses in a network?

- **A. Rogue DHCP server**
- B. DNS poisoning
- C. Denial-of-service
- D. Social engineering

Answer: A

Explanation:

Definition of a Rogue DHCP Server:

A rogue DHCP server is an unauthorized DHCP server on a network, which can assign IP addresses to devices without proper control, leading to IP address conflicts.

Impact of a Rogue DHCP Server:

IP Address Conflicts: Multiple devices may receive the same IP address from different DHCP servers, causing network connectivity issues.

Network Disruption: Devices may be assigned incorrect network configuration settings, disrupting network services and connectivity.

Comparison with Other Attacks:

DNS poisoning: Alters DNS records to redirect traffic to malicious sites, but does not cause IP address conflicts.

Social engineering: Involves manipulating individuals to gain unauthorized access or information, not directly related to IP address conflicts.

Denial-of-service (DoS): Floods a network or service with excessive traffic to disrupt operations, but does not cause duplicate IP addresses.

Prevention and Detection:

Implement network access control measures to prevent unauthorized devices from acting as DHCP servers.

Use DHCP snooping on switches to allow DHCP responses only from authorized DHCP servers.

NEW QUESTION # 99

Early in the morning, an administrator installs a new DHCP server. In the afternoon, some users report they are experiencing network outages. Which of the following is the most likely issue?

- A. The administrator did not provision enough MAC addresses.
- B. The administrator configured an incorrect default gateway.
- C. The administrator did not provision enough IP addresses.
- D. The administrator did not provision enough routes.

Answer: C

Explanation:

When a DHCP server is installed and not enough IP addresses are provisioned, users may start experiencing network outages once the available IP addresses are exhausted. DHCP servers assign IP addresses to devices on the network, and if the pool of addresses is too small, new devices or those renewing their lease may fail to obtain an IP address, resulting in network connectivity issues.
