Salesforce Analytics-Arch-201 Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none"> • Monitor and Maintain a Tableau Deployment: This section evaluates skills of Tableau Administrators in monitoring, maintaining, and optimizing Tableau environments. It involves creating custom administrative dashboards, conducting load testing using tools like TabJolt, and analyzing test results. Troubleshooting complex performance bottlenecks in workbooks and server resources is key, as is tuning caching and scaling strategies. It covers leveraging observability tools such as the Resource Monitoring Tool, analyzing logs and metrics, and adjusting architecture accordingly. Automation of maintenance functions using APIs, scripting, and scheduling is included, along with managing server extensions, content automation, dashboard extensions, web data connectors, and secure embedded solutions.
Topic 2	<ul style="list-style-type: none"> • Deploy Tableau Server: This domain assesses the ability of Tableau Administrators to perform production-ready deployments of Tableau Server. It encompasses installing and configuring Tableau Server with external components, supporting air-gapped environments, disaster recovery validations, and blue-green deployments. It includes configuring and troubleshooting various authentication methods such as SAML, Kerberos, and LDAP. The section also covers implementing encryption strategies, installing and verifying Tableau Server on Linux and Windows platforms, resolving installation and configuration issues, and managing service accounts and logging.

Topic 3	<ul style="list-style-type: none"> • Design a Tableau Infrastructure: This section of the exam measures skills of Tableau Consultants and focuses on planning and designing a complex Tableau deployment. It covers gathering user requirements, licensing strategies including Authorization-to-Run, high availability and disaster recovery planning, and mapping server add-ons to the organization's needs. It includes planning and implementing Tableau Cloud with Bridge, authentication, user provisioning, and multi-site configuration. Additionally, it addresses migration planning across Tableau products, operating systems, identity stores, and consolidations, as well as designing process topologies, sizing, node roles, and recommending server configurations including security, hardware, and disaster recovery.

Salesforce Certified Tableau Architect Sample Questions (Q167-Q172):

NEW QUESTION # 167

For a small startup with limited IT resources, which identity store and authentication configuration would be most suitable for their new Tableau Server deployment?

- **A. Using Tableau Server's built-in local identity store for simplicity and ease of management**
- B. Implementing a complex LDAP-based system for future scalability
- C. Requiring users to have separate credentials for Tableau Server, unrelated to other systems
- D. Integrating with an external enterprise-level identity provider, regardless of the cost

Answer: A

Explanation:

Using Tableau Server's built-in local identity store for simplicity and ease of management For a small startup with limited resources, using Tableau Server's built-in local identity store offers a simple and manageable solution, avoiding the complexity and cost of more advanced systems. Option A is incorrect as a complex LDAP system might be too resource-intensive for a small startup. Option C is incorrect because integrating with an external enterprise-level provider might be unnecessary and costly for a small team. Option D is incorrect because requiring separate credentials can lead to inefficient user management and a poor user experience.

NEW QUESTION # 168

After installing Tableau Server on a Linux system, you notice that the server is not integrating properly with an external LDAP server for user authentication. What should be the first trouble-shooting step?

- A. Reconfiguring all user roles and permissions within Tableau Server
- **B. Verifying the network connectivity and port accessibility between the Tableau Server and the LDAP server**
- C. Installing additional security certificates on the LDAP server
- D. Changing the LDAP server to a different authentication model

Answer: B

Explanation:

Verifying the network connectivity and port accessibility between the Tableau Server and the LDAP server The first step in troubleshooting integration issues between Tableau Server on Linux and an external LDAP server is to verify network connectivity and port accessibility. This includes ensuring that the necessary ports are open and that there are no network barriers preventing communication between the two servers. Option A is incorrect because changing the LDAP server's authentication model does not address potential connectivity issues. Option C is in-correct as reconfiguring user roles and permissions within Tableau Server is

unrelated to LDAP integration issues. Option D is incorrect because installing additional security certificates on the LDAP server is unlikely to resolve a connectivity or integration issue.

NEW QUESTION # 169

An organization is planning to migrate from Tableau Cloud to an on-premises Tableau Server. Which aspect is most critical to ensure a successful migration?

- A. Immediately discontinuing Tableau Cloud before starting the migration
- **B. Ensuring compatibility of data sources and security protocols between Tableau Cloud and Tableau Server**
- C. Prioritizing the migration of visualizations, irrespective of data source compatibility
- D. Migrating all users to Tableau Server without prior testing

Answer: B

Explanation:

Ensuring compatibility of data sources and security protocols between Tableau Cloud and Tableau Server This approach focuses on the compatibility of data sources and security protocols, which are critical for ensuring that the migrated environment functions correctly and securely. Option A is incorrect because discontinuing Tableau Cloud before starting the migration can lead to data and service disruptions. Option C is incorrect as migrating all users without testing can result in unforeseen issues impacting user experience and data integrity. Option D is incorrect because the migration of visualizations should be prioritized only after ensuring data source compatibility.

NEW QUESTION # 170

A large multinational corporation plans to deploy Tableau across various departments with diverse data access needs. The IT team needs to determine the optimal role distribution for users. Which of the following approaches best meets these requirements?

- A. Assign all users the "Viewer" role to maintain data security and control
- B. Implement a uniform "Explorer" role for all users to simplify management
- **C. Tailor user roles based on specific department needs and data access levels**
- D. Provide "Creator" roles to department heads and "Explorer" roles to their team members

Answer: C

Explanation:

Tailor user roles based on specific department needs and data access levels This approach ensures that each department gets the access they need while maintaining security and efficiency. It recognizes the varying requirements across departments and aligns role assignments accordingly. Option A is incorrect because assigning everyone the "Viewer" role is overly restrictive and may hinder the effective use of Tableau for data analysis and decision-making. Option B is incorrect as it oversimplifies the distribution of roles without considering the specific needs and data access requirements of individual team members. Option C is incorrect because a uniform role for all users does not account for the diverse needs and access levels required in a large multinational corporation.

NEW QUESTION # 171

In a scenario where Tableau Server on Linux is experiencing performance issues, which logs would be most useful to analyze first to diagnose the problem?

- A. The database logs to assess query execution times and database performance
- **B. The Tableau Server performance logs that include information on server processes and resource usage**
- C. The Linux system's authentication logs to check for unauthorized access attempts
- D. The Linux system's boot logs to review the server startup sequence

Answer: B

Explanation:

The Tableau Server performance logs that include information on server processes and resource usage When diagnosing performance issues with Tableau Server on Linux, the Tableau Server performance logs are most useful. These logs provide information on server processes, resource usage, and potential bottlenecks in server performance. Analyzing these logs can help identify specific areas that are impacting the overall performance of Tableau Server. Option A is incorrect because authentication logs are primarily used for security auditing and are less likely to provide insights into performance issues. Option C is incorrect as

boot logs are useful for startup issues but not typically for ongoing performance problems. Option D is incorrect because while database logs can provide insights into database performance, they are not the first resource to check for general performance issues with Tableau Server.
