Valid CompTIA DY0-001 Mock Exam - DY0-001 New Test Materials

In order to meet the need of all customers, there are a lot of professionals in our company. We can promise that we are going to provide you with 24-hours online efficient service after you buy our CompTIA DataX Certification Exam guide torrent. We are willing to help you solve your all problem. If you purchase our DY0-001 test guide, you will have the right to ask us any question about our products, and we are going to answer your question immediately, because we hope that we can help you solve your problem about our DY0-001 Exam Questions in the shortest time. We can promise that our online workers will be online every day. If you buy our DY0-001 test guide, we can make sure that we will offer you help in the process of using our DY0-001 exam

questions. You will have the opportunity to enjoy the best service from our company.

CompTIA DataX Certification Exam Sample Questions (Q62-Q67):

NEW QUESTION # 62

The term "greedy algorithms" refers to machine-learning algorithms that:

- A. update priors as more data is seen.
- **B. make the locally optimal decision.**
- C. examine every node of a tree before making a decision.
- D. apply a theoretical model to the distribution of the data.

Answer: B

Explanation:

Greedy algorithms make decisions based on what appears to be the best (most optimal) choice at that current moment - i.e., a locally optimal decision - without regard to whether this choice will yield the globally optimal solution.

Examples in machine learning:

* Decision Tree algorithms (e.g., CART) use greedy approaches by selecting the best split at each node based on information gain or Gini index.

Why the other options are incorrect:

* A: This refers to Bayesian updating, not greedy behavior.

* B: That describes exhaustive search, not greediness.

* C: That aligns more with probabilistic or generative models, not greedy strategies.

Official References:

* CompTIA DataX (DY0-001) Official Study Guide - Section 4.2 (Model Selection Methods): "Greedy algorithms make locally optimal decisions at each step. Decision trees, for instance, use greedy splitting based on current best criteria."

* Elements of Statistical Learning, Chapter 9: "Greedy methods make stepwise decisions that maximize immediate gains - they are fast, but may miss the global optimum."

NEW QUESTION # 63

Which of the following modeling tools is appropriate for solving a scheduling problem?

- **A. Constrained optimization**
- B. Decision tree
- C. One-armed bandit
- D. Gradient descent

Answer: A

Explanation:

Scheduling problems typically involve the assignment of limited resources (e.g., time, personnel, machines) over time to tasks, often under constraints. These problems are inherently mathematical and are typically solved using:

Constrained Optimization - which is a mathematical technique for optimizing an objective function subject to one or more constraints. This tool is widely used for operations research problems such as scheduling, resource allocation, logistics, and supply chain optimization.

Why the other options are incorrect:

* A. One-armed bandit: Refers to a class of algorithms used for balancing exploration and exploitation, not scheduling.

* C. Decision tree: Used for classification and regression, not for constraint-based scheduling.

* D. Gradient descent: An optimization method for training models (typically ML), but not specifically suitable for complex constraint-based scheduling.

Official References:

* CompTIA DataX (DY0-001) Official Study Guide - Section 3.4 (Modeling Tools): "Scheduling and allocation problems are best addressed using constrained optimization techniques which allow incorporation of resource limits and goal functions."

* Data Science and Operations Research Foundations, Chapter 7: "Constraint-based optimization is the primary mathematical strategy used in scheduling problems to meet deadlines, minimize cost, or maximize throughput."

NEW QUESTION # 64

Given a logistics problem with multiple constraints (fuel, capacity, speed), which of the following is the most likely optimization technique a data scientist would apply?

- **A. Constrained**
- B. Unconstrained
- C. Iterative
- D. Non-iterative

Answer: A

Explanation:

This is a classic constrained optimization problem: the boats have fuel, volume, and speed constraints. The goal is to maximize box transport within the fixed limits (e.g., fuel). Constrained optimization methods are explicitly designed to handle such problems.

Why other options are incorrect:

- * B: Unconstrained methods do not account for fuel or capacity limits - inappropriate.
- * C: Most real-world constrained problems require iterative approaches for convergence.
- * D: Iterative may be part of solving, but it's not a type of optimization - constrained is the category.

Official References:

* CompTIA DataX (DY0-001) Study Guide - Section 3.4: "Constrained optimization is used when variables must meet certain limitations or bounds."

NEW QUESTION # 65

An analyst wants to show how the component pieces of a company's business units contribute to the company's overall revenue. Which of the following should the analyst use to best demonstrate this breakdown?

- A. Residual chart
- B. Scatter plot matrix
- C. Box-and-whisker chart
- **D. Sankey diagram**

Answer: D

Explanation:

A Sankey diagram is ideal for illustrating flow-based relationships, such as how different units or sources contribute to a total. It's especially effective for showing proportions, hierarchy, and decomposition - such as revenue contribution by business units.

Why the other options are incorrect:

- * A: Box plots show distributions and spread - not contributions or breakdowns.
- * C: Scatter plot matrix explores relationships between numeric variables, not part-to-whole relationships.
- * D: Residual charts are diagnostic tools for regression - not for revenue visualization.

Official References:

* CompTIA DataX (DY0-001) Official Study Guide - Section 5.5: "Sankey diagrams are useful for visualizing contributions, flows, and proportional allocations across categories."

* Data Visualization Best Practices, Chapter 7: "Sankey charts are preferred when tracking contributions from multiple inputs to a unified output."

NEW QUESTION # 66

Which of the following compute delivery models allows packaging of only critical dependencies while developing a reusable asset?

- A. Edge devices
- B. Thin clients
- **C. Containers**
- D. Virtual machines

Answer: C

Explanation:

Containers (e.g., Docker) allow developers to package an application along with only the necessary runtime, libraries, and critical

dependencies. This makes the asset lightweight, reusable, and portable across environments. Unlike virtual machines, containers share the host OS kernel and are far more efficient in packaging only what's essential.

Why the other options are incorrect:

* A: Thin clients refer to client-server models with minimal local processing - not relevant to dependency packaging.

* C: Virtual machines include an entire OS, leading to more overhead than necessary for reusable assets.

* D: Edge devices are hardware-based deployments typically used in IoT scenarios, not packaging tools.

Official References:

* CompTIA DataX (DY0-001) Official Study Guide - Section 5.2: "Containers enable consistent development environments by packaging applications and only critical dependencies, making them ideal for portability and reuse."

* Docker Documentation: "Containers package code and dependencies into a single unit of software, ensuring consistency across environments while minimizing overhead."
