Passing an exam requires diligent practice, and using the right study Microsoft Certification Exams material is crucial for optimal performance. With this in mind, Exam4Labs has introduced a range of innovative AZ-400 practice test formats to help candidates prepare for their AZ-400. The platform offers three distinct formats, including a desktop-based Microsoft AZ-400 practice test software, a web-based practice test, and a convenient PDF format.

Microsoft AZ-400 Exam is a highly sought-after certification, as DevOps is rapidly being adopted by organizations across the world. By gaining this certification, professionals can demonstrate their expertise in managing the software development lifecycle in a highly efficient, automated and secure manner. Additionally, this certification can lead to better job opportunities and higher salaries, making it a highly recommended certification for IT professionals.

Important Prerequisites

As a future accredited DevOps Engineer, you need to know how to design and implement various strategies to improve the activities performed during the working process. These strategies include feedback, monitoring, delivery, testing, continuous integration, compliance security, source control, infrastructure, code, and collaboration. You should also have expertise in working with technologies, processes, and people to continuously deliver business value.

Get Ready for AZ-400 with Microsoft's Realistic Exam Questions and Accurate Answers

If you choose to buy our AZ-400 study pdf torrent, it is no need to purchase anything else or attend extra training. We promise you can pass your AZ-400 actual test at first time with our Microsoft free download pdf. AZ-400 questions and answers are created by our certified senior experts, which can ensure the high quality and high pass rate. In addition, you will have access to the updates of AZ-400 Study Material for one year after the purchase date.

Microsoft Designing and Implementing Microsoft DevOps Solutions Sample Questions (Q518-Q523):

NEW QUESTION # 518

You use GitHub for source control and Azure Boards for project management. GitHub and Azure Boards are integrated.

You plan to create a pull request in GitHub.

You need to automatically link the request to an existing Azure Boards work item by using the text of AB#<WORKITEMNUMBER>.

To which two elements can you add the text? Each correct answer presents a complete solution.
 NOTE: Each correct selection is worth one point.

- A. milestone
- B. description
- C. title
- D. comment
- E. label

Answer: B,C

Explanation:

You can add the text "AB#<WORKITEMNUMBER>" to the title or description of the pull request in GitHub, which will automatically link the request to an existing Azure Boards work item with that number.

NEW QUESTION # 519

Your company has four projects. The version control requirements for each project are shown in the following table.

Project	Requirement
Project 1	Project leads must be able to restrict access to individual files and folders in the repository.
Project 2	The version control system must enforce the following rules before merging any changes to the main branch. <ul style="list-style-type: none"> • Changes must be reviewed by at least two project members. • Changes must be associated to at least one work team.
Project 3	The project members must be able to work in Azure Repos directly from Xcode.
Project 4	The release branch must only be viewable or editable by the project leads.

You plan to use Azure Repos for all the projects.

Which version control system should you use for each project? To answer, drag the appropriate version control systems to the correct projects. Each version control system may be used once, more than once, or not at all. You may need to drag the split bar between panes or scroll to view content.

NOTE: Each correct selection is worth one point.

Version Control Systems

- Git
- Perforce
- Subversion
- Team Foundation Version Control

NEW QUESTION # 520

You plan to deploy a runbook that will create Azure AD user accounts.

You need to ensure that runbooks can run the AzurePowerShell cmdlets for Azure Active Directory.

To complete this task, sign in to the Microsoft Azure portal.

Answer:

Explanation:

See solution below.

Explanation:

Azure Automation now ships with the Azure PowerShell module of version 0.8.6, which introduced the ability to non-interactively authenticate to Azure using OrgId (Azure Active Directory user) credential-based authentication. Using the steps below, you can set up Azure Automation to talk to Azure using this authentication type.

Step 1: Find the Azure Active Directory associated with the Azure subscription to manage:

1. Log in to the Azure portal as the service administrator for the Azure subscription you want to manage using Azure Automation.

You can find this user by logging in to the Azure portal as any user with access to this Azure subscription, then clicking Settings, then Administrators.

2. Note the name of the directory associated with the Azure subscription you want to manage. You can find this directory by clicking Settings, then Subscriptions.

Step 2: Create an Azure Active Directory user in the directory associated with the Azure subscription to manage:

You can skip this step if you already have an Azure Active Directory user in this directory, and plan to use this OrgId to manage Azure.

1. In the Azure portal click on Active Directory service.

2. Click the directory name that is associated with this Azure subscription.
3. Click on the Users tab and then click the Add User button.
4. For type of user, select "New user in your organization." Enter a username for the user to create.
5. Fill out the user's profile. For role, pick "User." Don't enable multi-factor authentication. Multi-factor accounts cannot be used with Azure Automation.
6. Click Create.
7. Jot down the full username (including part after @ symbol) and temporary password.

Step 3: Allow this Azure Active Directory user to manage this Azure subscription.

1. Click on Settings (bottom Azure tab under StorSimple)

2. Click Administrators
3. Click the Add button. Type the full user name (including part after @ symbol) of the Azure Active Directory user you want to set up to manage Azure. For subscriptions, choose the Azure subscriptions you want this user to be able to manage. Click the check

mark.

Step 4: Configure Azure Automation to use this Azure Active Directory user to manage this Azure subscription. Create an Azure Automation credential asset containing the username and password of the Azure Active Directory user that you have just created. You can create a credential asset in Azure Automation by clicking into an Automation Account and then clicking the Assets tab, then the Add Setting button.

Note: Once you have set up the Azure Active Directory credential in Azure and Azure Automation, you can now manage Azure from Azure Automation runbooks using this credential.

NEW QUESTION # 521

You have an Azure web app named Webapp1.

You need to use an Azure Monitor query to create a report that details the top 10 pages of Webapp1 that failed.

How should you complete the query? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Answer:

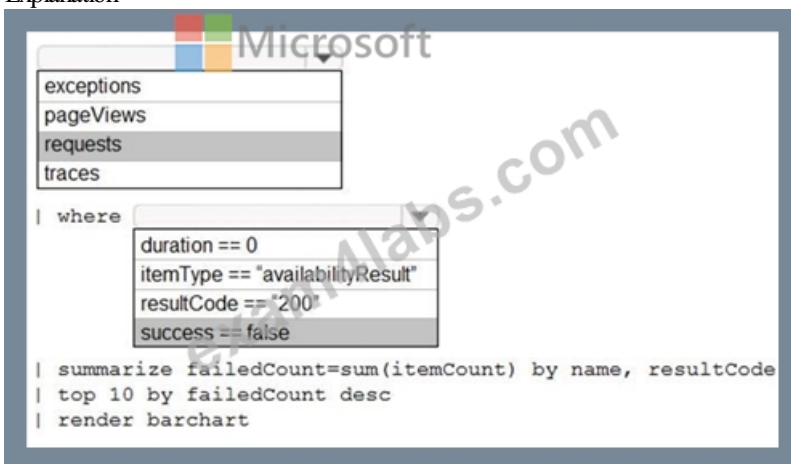

Explanation:

```
exceptions
pageViews
requests
traces

| where
  duration == 0
  itemType == "availabilityResult"
  resultCode == "200"
  success == false

| summarize failedCount=sum(itemCount) by name, resultCode
| top 10 by failedCount desc
| render barchart
```

Explanation

Box 1: requests

Failed requests (requests/failed):

The count of tracked server requests that were marked as failed.

Kusto code:

```
requests
| where success == 'False'
```

Box 2: success == false

NEW QUESTION # 522

SIMULATION

Initialize the default main branch, if it does not exist already.

In the User1-12345678 Azure DevOps project, you need to implement an approval process for the default main branch.

The process must use the four-eyes principle and have at least one approval on every iteration.

Answer:

Explanation:

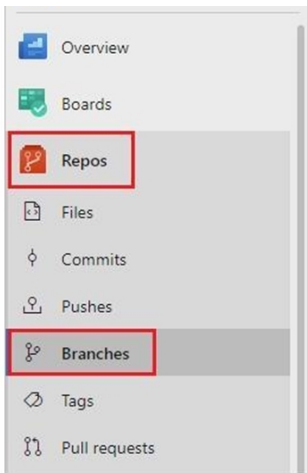

Azure DevOps, Azure Repos, Branch policies and settings

Configure branch policies

Phase 1. Select the correct branch

Step 1: To manage branch policies, select Repos > Branches to open the Branches page in the web portal.

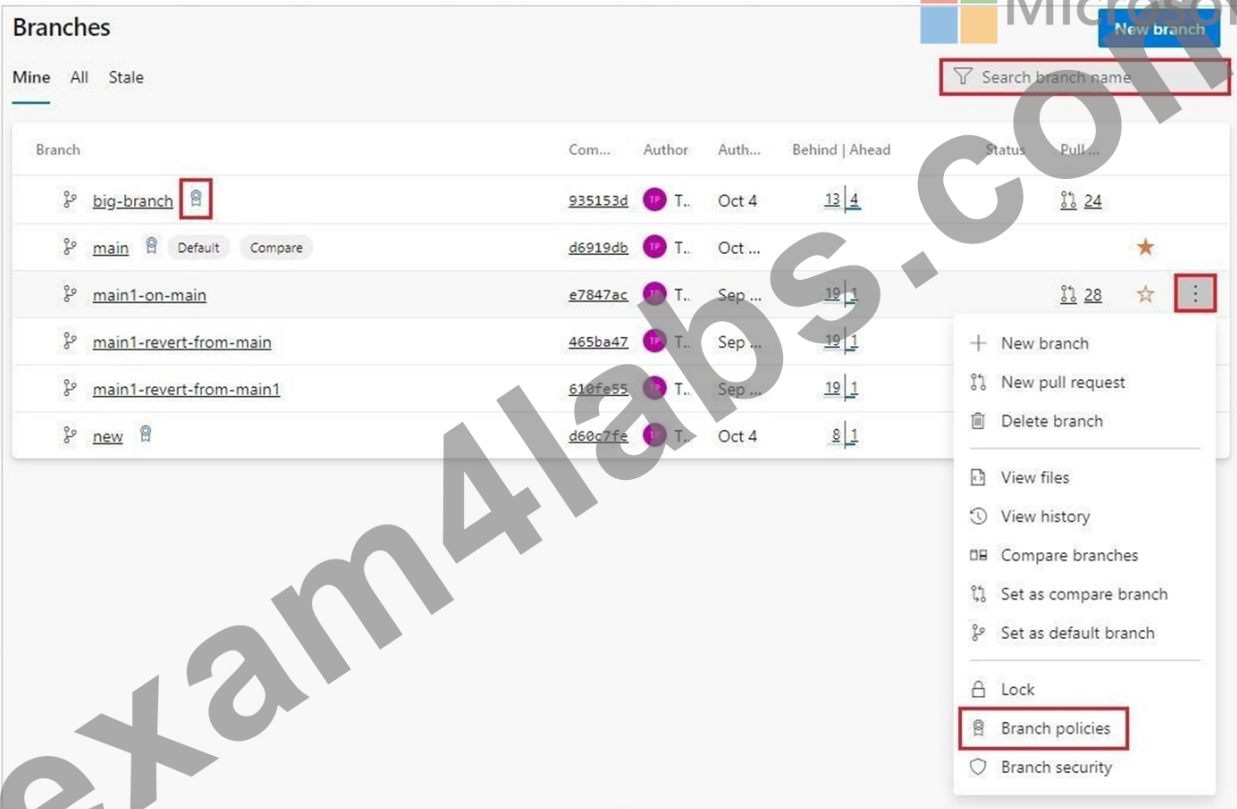

(You can also get to branch policy settings with Project Settings > Repository > Policies > Branch Policies > <Branch Name>.)

Step 2: To set branch policies, locate the branch you want to manage. You can browse the list or search for your branch in the Search branch name box at upper right. [Select the default main branch]

Select the More options icon next to the branch, and then select Branch policies from the context menu.

Phase 2: Configure approval

Require a minimum number of reviewers

Code reviews are important for software development projects. To ensure that teams review and approve PRs, you can require approval from a minimum number of reviewers. The basic policy requires that a specified number of reviewers approve the code, with no rejections.

Step 3: To set the policy, under Branch Policies, set Require a minimum number of reviewers to On. Enter the required number of reviewers, and select any of the following options:

On **Require a minimum number of reviewers**
 Require approval from a specified number of reviewers on pull requests.

Minimum number of reviewers

Allow requestors to approve their own changes

Prohibit the most recent pusher from approving their own changes

- Allow completion even if some reviewers vote to wait or reject
- When new changes are pushed:
 - Require at least one approval on the last iteration
 - Reset all approval votes (does not reset votes to reject or wait)
 - Reset all code reviewer votes

3a. [Select: Minimum number of reviewers: 2]

3b. [Select: When new changes are pushed:]

3c [Select Require at least one approval on the last approval of the last iteration]
