Free PDF Quiz PTC-AMCA - Updated AMCA Phlebotomy Technician Certification Exam New Braindumps

As long as you study with our PTC-AMCA exam braindumps, the benefits are more than you can consider, you are bound to pass the PTC-AMCA exam, let along various opportunities like getting promotion, being respected by surrounding people on your profession's perspective. All those beneficial outcomes come from your decision of our PTC-AMCA simulating questions. We are willing to be your side offering whatever you need compared to other exam materials that malfunctioning in the market.

Medical Technology AMCA Phlebotomy Technician Certification Exam Sample Questions (Q136-Q141):

NEW QUESTION # 136

Blood draws for a GTT in pregnancy are usually done at _____ after the test begins.

- A. 1 hour, 2 hours, and 3 hours
- B. 30 minutes, 60 minutes, 90 minutes, and 2 hours
- C. 2 hours, 4 hours, 6 hours, and 8 hours
- D. 30 minutes, 1 hour, 2 hours, and 4 hours

Answer: A

Explanation:

Blood draws for a GTT (glucose tolerance test) in pregnancy, which is done to screen for gestational diabetes, are usually done at 1 hour, 2 hours, and 3 hours after the test begins. Prior to beginning the timed portion of the test, a FBS (fasting blood sugar) is checked to ensure that the level is within a safe range. If so, the patient drinks the glucose solution within 5 minutes and the timed period of the test begins. The patient should be advised to eat no food and only drink water during the testing period. There are other variations of the GTT that require different testing intervals.

NEW QUESTION # 137

When selecting a vein for venipuncture, you should:

- A. Palpate visible veins.
- B. Select a vein close to a pulse.
- C. Use the basilic vein as an alternative if the median cubital vein cannot be located.
- D. Use your thumb to palpate a vein.

Answer: A

Explanation:

In selecting a vein for venipuncture, even visible veins should be palpated to judge suitability for venipuncture. If the median cubital vein cannot be located, the basilic vein should not be used unless no other vein is more prominent because of the possibility of nerve injury or damage to the brachial artery. Do not use veins that overlie or are located close to a pulse to avoid the risk of puncturing an artery. The thumb should not be used because it has a pulse and may cause a vein to be mistaken for an artery.

NEW QUESTION # 138

To reduce the risk of transmission of a bloodborne pathogen via an open wound, the phlebotomist should:

- A. Cleanse the wound with bleach.
- B. Cleanse the wound with an antiseptic.
- C. Squeeze the wound to release fluid.
- D. Cleanse the wound with soap and water.

Answer: D

Explanation:

Cleansing the wound with plain soap and water for at least 30 seconds is useful in reducing the risk of transmission of a bloodborne pathogen via an open wound. Squeezing the wound or cleansing the wound with an antiseptic, bleach, or other caustic agent is not recommended.

NEW QUESTION # 139

Waived tests are:

- A. Complex tests that require special handling
- B. Tests that cannot be carried out by phlebotomists
- C. Tests that are not required for a specific diagnosis
- D. CLIA-designated tests that are fairly simple and carry a low risk of error

Answer: D

Explanation:

Waived tests are Clinical Laboratory Improvement Amendments (CLIA)-designated tests that are fairly simple and carry a low risk of error, so they are generally reliable if carried out properly and if the equipment is in operating condition. Most point-of-care (POC) tests are waived, although not all are. Phlebotomists may only carry out POC tests that are waived. Waived POC tests may be used in the home environment. For example, glucometers are used by both healthcare providers and patients to monitor blood sugar.

NEW QUESTION # 140

For pediatric or critically ill patients, what percentage of total blood volume can be collected within a 24-hour period?

- A. 10%
- B. 6-8%
- C. 1-5%
- D. <1%

Answer: C

Explanation:

The percentage of total blood volume that can be collected from pediatric or critically ill patients is 1-5% within a 24-hour period, up to a total of 10% over an 8-week period. Therefore, it is important to estimate the patient's total blood volume and to monitor the volume of blood withdrawn in order to prevent iatrogenic anemia and/or hypovolemia. In some cases, it may be advisable to obtain capillary blood for tests to decrease the volume of blood needed, especially for young children.

NEW QUESTION # 141

.....

Managing time during the Medical Technology PTC-AMCA exam is a challenging task. Most candidates cannot manage their time during the Medical Technology PTC-AMCA exam, leave the questions, and fail. Time management skills can help students gain excellent marks in the PTC-AMCA Exam. Medical Technology PTC-AMCA practice exam on the software helps you identify which kind of AMCA Phlebotomy Technician Certification Exam PTC-AMCA questions are more time-consuming, and they would be able to assess their efficiency in answering questions.
