NEW QUESTION # 144

A developer has an integer variable called `maxAttempts`. The developer needs to ensure that once `maxAttempts` is initialized, it preserves its value for the length of the Apex transaction; while being able to share the variable's state between trigger executions. How should the developer declare `maxAttempts` to meet these requirements?

- A. Declare `maxAttempts` as a variable on a helper class
- B. Declare `maxAttempts` as a constant using the `static` and `final` keywords
- C. Declare `maxAttempts` as a member variable on the trigger definition.
- D. Declare `maxAttempts` as a private static variable on a helper class

Answer: D

Explanation:

The best way to declare `maxAttempts` to meet the requirements is to declare it as a private static variable on a helper class. This will ensure that the variable is initialized only once per Apex transaction, and that its value is preserved and shared across trigger executions. A private static variable is a variable that belongs to a class and not an instance, and that can only be accessed within the class. A helper class is a class that contains common methods or variables that can be used by other classes or triggers.
