SAP Certified Associate - Security Administrator Sample Questions (Q68-Q73):

NEW QUESTION # 68

Which user types can log on to the SAP S/4HANA system in interactive mode? Note: There are 2 correct answers to this question.

- **A. Dialog User**
- B. System User
- **C. Service User**
- D. Communication User

Answer: A,C

Explanation:

In SAP S/4HANA, the user types that can log on in interactive mode are Dialog User and Service User.

Dialog Users are designed for human interaction, allowing individuals to log on via the SAP GUI or Fiori launchpad to perform tasks like data entry or reporting. They support full interactive access, including personalized sessions and user-specific settings. Service Users, while primarily used for web-based or anonymous access (e.g., via Fiori apps or web services), can also support limited interactive logon in specific scenarios, such as testing or administrative tasks, depending on system configuration. System Users are intended for background processes, like batch jobs, and do not support interactive logon. Communication Users are used for machine-to-machine interactions, such as API calls, and are not configured for interactive access. These distinctions ensure that interactive access is restricted to appropriate user types, enhancing security by limiting human logon capabilities to Dialog and Service Users while aligning with SAP's user management framework.

NEW QUESTION # 69

Which of the following functions within SAP GRC Access Control support access certification and review?

Note: There are 2 correct answers to the question.

- **A. Role Review**
- B. GO
- **C. Review CI User Reaffirm**
- D. Role Ream

Answer: A,C

NEW QUESTION # 70

Which protocol is the industry standard for provisioning identity and access management in hybrid landscapes?

- A. SSL
- B. OIDC
- C. SAML
- **D. SCIM**

Answer: D

Explanation:

The System for Cross-domain Identity Management (SCIM) is the industry standard protocol for provisioning identity and access management in hybrid landscapes. SCIM enables automated user provisioning and deprovisioning across different systems, including cloud and on-premise environments, by standardizing the exchange of user identity data. It supports operations like creating, updating, and deleting user accounts, making it ideal for managing identities in hybrid SAP landscapes where integration between SAP Cloud Identity Services and on-premise systems is required. SAML (Security Assertion Markup Language) is used for single

sign-on authentication, not provisioning. OIDC (OpenID Connect) is an authentication protocol built on OAuth, and SSL (Secure Sockets Layer) is a security protocol for data encryption, not identity provisioning. SCIM's role as a provisioning standard ensures efficient and secure identity management, reducing administrative overhead and enhancing interoperability in complex SAP and non-SAP hybrid environments.

NEW QUESTION # 71

What is required to centrally administer a user's master record using Central User Administration? Note:

There are 3 correct answers to this question.

- A. An RFC destination to the target client
- B. An entry in transaction BD54 for the child system
- C. An ALE distribution model
- D. An RFC destination to the target system
- E. An existing master record in the target client for the user

Answer: A,B,C

Explanation:

Central User Administration (CUA) in SAP enables centralized management of user master records across multiple systems. To implement CUA, an ALE (Application Link Enabling) distribution model is required to define the data exchange between the CUA master system and child systems, ensuring user data is consistently distributed. An RFC (Remote Function Call) destination to the target client is necessary to establish a secure communication channel for transmitting user data to specific clients in the child systems. Additionally, an entry in transaction BD54 (Logical Systems) for the child system is needed to define the child system as a logical system in the CUA landscape, enabling it to receive user data. An RFC destination to the target system (not client-specific) is less precise, and an existing master record in the target client is not required, as CUA creates or updates these records centrally. These components ensure that CUA operates effectively, streamlining user administration while maintaining security and consistency across SAP systems.

NEW QUESTION # 72

In SAP S/4HANA Cloud Public Edition, what does the ID of an SAP-predefined Space refer to?

- A. The SAP Fiori applications it was defined for
- B. The software release it was created for
- C. The business roles it is to be assigned to
- D. The business area it was designed for

Answer: D

NEW QUESTION # 73
