ASQ Certified Manager of Quality/Organizational Excellence Exam 認定 CMQ-OE 試験問題 (Q70-Q75):

質問 # 70

Which of the following steps should an organization take immediately after creating its strategic plan?

- **A. Translating the plan into actions**
- B. Leveraging customer needs into profit opportunities
- C. Defining its mission and vision
- D. Deploying its quality' goals

正解: A

質問 # 71

When a companywide professional development program is being planned, which of the following factors should be considered first?

- A. Organizational job descriptions
- B. Resources available for education
- **C. Corporate mission and strategy**
- D. Areas of customer dissatisfaction

正解: C

解説:

The corporate mission and strategy serve as the guiding principles for an organization. By considering these factors first, professionals can ensure that the development program aligns with the organization's purpose and strategic priorities. It helps in identifying the skills and competencies needed to achieve organizational goals. Once the alignment with the mission and strategy is established, other factors such as areas of customer dissatisfaction, organizational job descriptions, and available resources for education can be addressed in a more targeted manner¹.

質問 # 72

If an employee compensation plan is linked to pre-established company, team, and functional area goals, the plan is described as

- A. task-based
- B. value-based
- C. objective-based
- **D. performance-based**

正解: **D**

解説:

The ASQ Certified Manager of Quality/Organizational Excellence Handbook provides insights into various aspects of quality management, including compensation plans. In this context, a performance-based compensation plan is one that directly links an employee's compensation to their performance. It is designed to incentivize employees to achieve specific goals, whether at the company, team, or functional level. By aligning compensation with performance, organizations can motivate employees to excel and contribute to overall organizational success. Such plans often involve clear metrics, targets, and evaluations to determine the level of performance achieved. The performance-based approach emphasizes results and encourages employees to actively participate in achieving organizational objectives¹.

質問 # 73

A process capability study is designed to show the

- A. potential for errors in a process
- **B. range of variation in process**
- C. cause of special effects in a process
- D. capacity of a process

正解: **B**

解説:

Process capability is a statistical measure of the inherent process variability of a given characteristic. It assesses how well a process can consistently produce outputs within specifications. In a process capability study, we analyze the range of variation in the process to determine its ability to meet customer requirements or engineering tolerances. By understanding this variation, we can identify whether the process is capable of producing products that meet quality standards and expectations. The study does not specifically address the potential for errors, capacity, or the cause of special effects in the process¹².

質問 # 74

Which of the following elements is basic to a reliability study?

- A. Conformity
- **B. Probability**
- C. Availability
- D. Cost

正解: **B**

解説:

Detailed Explanation:

The correct answer is D. Probability.

A reliability study is fundamentally based on the concept of probability. Reliability is commonly defined as the probability that a product, system, or component will perform its intended function under stated conditions for a specified period of time.

This means reliability analysis depends on evaluating the likelihood of:

- * Failure-free performance
- * Survival over time
- * Consistent operation under expected conditions

Because reliability is expressed in probabilistic terms, probability is the most basic and foundational element in a reliability study.

Why the other options are incorrect:

A). Cost

Cost may be considered in business decisions related to reliability, but it is not the basic technical element of a reliability study.

B). Conformity

Conformity refers to meeting specifications. While related to quality, it is not the primary foundation of reliability analysis.

C). Availability

Availability is related to reliability and maintainability, but it is a derived operational measure rather than the most basic underlying element.

Quality Management Excellence reference basis:

This aligns with Quality Management Excellence principles that emphasize:

- * analytical decision-making,
- * use of measurable and evidence-based methods,
- * and applying the correct technical concept to product performance evaluation.

Reliability is not simply about whether a product conforms at one point in time; it is about the probability of continued performance over time.
