New UiPath-ADPv1 Practice Test Online | Pass-Sure UiPath UiPath-ADPv1: UiPath (ADPv1) Automation Developer Professional 100% Pass

BTW, DOWNLOAD part of BootcampPDF UiPath-ADPv1 dumps from Cloud Storage: https://drive.google.com/open?id=1xBFuFuEHVahaHPjUTbDdghwfDqgDE2_V

BootcampPDF is the ideal platform for you to prepare successfully for the UiPath UiPath-ADPv1 certification. Recognize that it is a defining moment in your life as your prospects rest on making a mark in the sector. Do not delay pursuing the UiPath (ADPv1) Automation Developer Professional UiPath-ADPv1 Exam Certification with the help of our exceptional UiPath-ADPv1 dumps.

Our UiPath-ADPv1 study guide has become a brand for our candidates to get help for their exams. Because our UiPath-ADPv1 learning materials contain not only the newest questions appeared in real exams in these years, but the most classic knowledge to master. Besides, it is unavoidable that you may baffle by some question points during review process of the UiPath-ADPv1 Exam Questions, so there are clear analysis under some necessary questions.

>> UiPath-ADPv1 Practice Test Online <<

100% Pass Quiz 2026 UiPath UiPath-ADPv1 – Marvelous Practice Test Online

Our experts have worked hard for several years to formulate UiPath-ADPv1 exam braindumps for all examiners. Our UiPath-ADPv1 study materials not only target but also cover all knowledge points. And our practice materials also have a statistical analysis function to help you find out the deficiency in the learning process of UiPath-ADPv1 practice materials, so that you can strengthen the training for weak links. In this way, you can more confident for your success since you have improved your ability.

UiPath (ADPv1) Automation Developer Professional Sample Questions (Q43-Q48):

NEW QUESTION # 43
Where is the TransactionNumber incremented in the REFramework?

- A. In the RetryCurrentTransaction.xaml workflow and in the SetTransactionStatus.xaml workflow.
- B. Only in the RetryCurrentTransaction.xaml workflow.
- C. In the New Transaction transition.
- D. Only in the SetTransactionStatus.xaml workflow.

Answer: D

Explanation:
The TransactionNumber is incremented only in the SetTransactionStatus.xaml workflow, which is invoked at the end of each transaction. This workflow updates the status of the current transaction item in Orchestrator and increments the TransactionNumber by one. The TransactionNumber is used to keep track of the number of transactions processed by the robot and to get the next transaction item from the queue. References:
[SetTransactionStatus.xaml]

NEW QUESTION # 44
Suppose you have the following workflow that verifies if the text value of an element is equal to "Work Items":

The configuration for the Verify Control Attribute and Get Text activities is shown below:

The element and its selector are highlighted in the image below:

Taking into consideration that the page shown above will be present on screen at execution time, what will be the result of the Verify Control Attribute activity?

- A. Verification will be failed because the actual value is different than expected value.
- B. Verification will be passed.
- C. Verification will not be executed.
- D. An exception will be thrown because there is no variable set in the Save to property of the Get text activity.

Answer: B

Explanation:
The workflow in question uses a 'Verify Control Attribute' activity to check if the text value of a UI element is equal to "Work Items". The Get Text activity is used to retrieve the text from the specified UI element, and the result of this activity is compared against the expected value "Work Items".
From the provided information, the 'Verify Control Attribute' activity has been set up with the Expression
"Work Items" and the Operator set to Equality. The 'Get Text' activity is configured to extract the text from the UI element with the visible text "Work Items", as indicated by the selector shown in the image.
Since the actual value of the UI element's text is "Work Items" (which matches the expected value in the
'Verify Control Attribute' activity), and provided that the 'Get Text' activity successfully retrieves this value, the verification will pass.
The configuration indicates that the activity should take a screenshot only if the verification fails (TakeScreenshotIfFailed is set to True), which will not be the case here.
Therefore, assuming that there are no other issues such as incorrect selectors or unexpected changes to the UI element at execution time, the result of the 'Verify Control Attribute' activity will be a pass.

NEW QUESTION # 45
When building automation projects, which statement is true regarding Perform Remote Debugging?

- A. Perform Remote Debugging enables developers to design new III elements for the automation project.
- B. Perform Remote Debugging is only possible when the automation project does not involve Orchestrator queues and assets.
- C. Perform Remote Debugging allows developers to debug a project on a different machine using a web- based interface.
- D. Perform Remote Debugging refers to the process of testing and debugging an automation project on the same machine where UiPath Studio is installed.

Answer: C

Explanation:
Comprehensive and Detailed Explanation: Remote Debugging is a feature of UiPath Studio that allows developers to run and debug automation projects on robots deployed to remote machines, including on Linux robots that can run cross-platform projects1. It enables developers to connect to the remote robot using either a remote machine connection or an unattended robot connection, and then use the Studio debugging tools to inspect the execution and troubleshoot any issues1. Remote Debugging uses a web-based interface that shows the UI elements and the data of the remote machine, as well as the breakpoints, variables, and output of the project2.
The other options are incorrect because:

* Option A is incorrect because Remote Debugging is not limited by the involvement of Orchestrator queues and assets in the automation project. Remote Debugging can work with any project that can be executed by a robot on a remote machine, regardless of the Orchestrator entities used1.
* Option B is incorrect because Remote Debugging does not enable developers to design new UI elements for the automation project. Remote Debugging is only used for testing and debugging existing projects, not for creating or modifying them1.
* Option C is incorrect because Remote Debugging does not refer to the process of testing and debugging an automation project on the same machine where UiPath Studio is installed. That process is called Local Debugging, which is the default debugging mode in Studio3.

NEW QUESTION # 46
What is the purpose of the Interval filter in the Orchestrator's Monitoring page?

* A. It allows you to control the granularity of the displayed data and check the health of your system in either the last day or the last hour.
* B. It allows you to choose between background and foreground processes for the displayed data.
* C. It enables you to sort the displayed data based on job priorities.
* D. It allows you to allocate licenses per machine for the displayed data.

Answer: A

Explanation:
The purpose of the Interval filter in the Orchestrator's Monitoring page is to allow you to control the granularity of the displayed data and check the health of your system in either the last day or the last hour. The Monitoring page provides various metrics and charts that show the status and performance of your robots, processes, queues, and transactions. The Interval filter lets you choose the time frame for the data that you want to see. You can select either the last day or the last hour as the interval. The data will be updated accordingly and show you the trends and changes in your system over the selected period. This can help you identify any issues or anomalies and take corrective actions if needed.

NEW QUESTION # 47
What are the five severity levels of Orchestrator alerts?

* A. Info. Success. Warning. Error. Critical.
* B. Info, Completed. Warning, Error. Fatal.
* C. Information, Complete. Warning, Error, Failure.
* D. Info, Success, Warn, Error, Fatal.

Answer: D

Explanation:
Orchestrator alerts are real-time notifications related to robots, queue items, triggers, and more. Alerts can have one of the following severity levels, which indicate the importance and impact of the events1:
Info - notifies you about low importance events, that do not interrupt the process execution, such as robots becoming available, users being assigned as reviewers, etc.
Success - notifies you about a successful status, such as a job being completed, a queue item being processed, etc.
Warn - notifies you about possible risky events that may interrupt your process execution, but any interruption can be recovered, such as queue items failing with business exceptions, triggers not being able to create new jobs, etc.
Error - notifies you about imminent risky events that prevent the process from executing successfully, such as jobs failing, robots not responding, queue items failing with application exceptions, etc.
Fatal - notifies you about events that force-stop the process execution, such as robots going offline or being disconnected, etc.
Option A is the correct answer, as it lists the five severity levels of Orchestrator alerts as defined in the documentation1. Option B is incorrect, because there is no Critical severity level, but rather Fatal. Option C is incorrect, because there are no Information, Complete, or Failure severity levels, but rather Info, Success, and Fatal. Option D is incorrect, because there are no Completed or Fatal severity levels, but rather Success and Fatal.
