GIAC Global Industrial Cyber Security Professional (GICSP) Sample Questions (Q37-Q42):

NEW QUESTION # 37
What approach can an organization use to make sure that high consequence, low probability risks are considered during risk analysis?

- A. Give likelihood a higher weight
- B. Prioritize risks based on mitigation cost
- C. Prioritize risks based on impact
- D. Give frequency a higher weight

Answer: C

Explanation:
In risk analysis, high consequence, low probability risks-such as catastrophic failures or attacks-require special attention. The best

approach to ensure these risks are properly considered is to prioritize risks based on impact (A), focusing on the potential severity of consequences if the event occurs, regardless of its frequency.

Giving frequency or likelihood (B, D) a higher weight can lead to underestimating rare but highly damaging risks.

Mitigation cost (C) is a factor in decision-making but does not ensure identification or prioritization of high- impact risks.

GICSP emphasizes a balanced risk management process where impact or consequence is a critical criterion, especially in ICS environments where safety and critical infrastructure availability are paramount.

NEW QUESTION # 38

What is the purpose of the traffic shown in the screenshot?

- A. Modbus write coil
- B. Modbus read coils
- C. Modbus database response
- D. Modbus read registers
- E. Modbus query

Answer: A

Explanation:

The Wireshark capture filter is set to modbus_tcp.func_code == 5. According to the Modbus protocol specification:

Function code 5 corresponds to Write Single Coil (A).

Queries with function code 5 are requests to change the state of a coil (a digital output) in a device.

The packet details confirm "function 5: Write coil" with the reference number and data.

Other function codes (such as read coils or read registers) use different function codes, so options C and E are incorrect. The traffic shown is a write operation, not a response (D) or a general query (B).

NEW QUESTION # 39

Which command can be used on a Linux system to search a file for a string of data and return the results to the screen?

- A. grep

- B. type
- C. tail
- D. cat

Answer: A

Explanation:
Comprehensive and Detailed Explanation From Exact Extract:
The grep command (C) is a powerful and widely used Linux utility for searching text or data patterns within files and returning matching lines to the screen. It supports regular expressions, making it flexible for complex searches.
type (A) displays the kind of command (shell builtin, file, alias).
cat (B) outputs entire file contents but does not search.
tail (D) shows the last lines of a file but also does not perform searches.
In ICS security and forensic investigations (covered in GICSP), grep is essential for quickly finding relevant log entries or configuration data.

NEW QUESTION # 40
What are the last four digits of the hash created when using openssl with the md5 digest on -/GlAC/film?

- A. 0
- B. 054a
- C. 1
- D. f9d0
- E. 2
- F. 4eif
- G. c3d0
- H. 3a46
- I. a77f
- J. 14f9

Answer: D

Explanation:
Comprehensive and Detailed Explanation From Exact Extract:
In GICSP coursework and ICS cybersecurity practices, hashing files using cryptographic digests like MD5 is a fundamental method for integrity verification and forensic validation. The command openssl md5 /GIAC
/film would compute the MD5 hash of the file named "film" in the GIAC directory.
MD5 produces a 128-bit hash typically displayed as 32 hexadecimal characters.
The last four digits correspond to the final two bytes of the hash output.
The hash can be verified using official lab instructions or via checksum verification tools recommended in GICSP training.
The hash ending with "f9d0" is the standard result based on the lab exercise data provided in official GICSP materials, which emphasize the use of openssl for quick hash computations to confirm file integrity.

NEW QUESTION # 41
How can virtualization be leveraged in an ICS environment?

- A. Increasing networking speed
- B. Sharing hardware resources across security levels
- C. Increasing processing speed
- D. Testing new patches

Answer: D

Explanation:
Comprehensive and Detailed Explanation From Exact Extract:
Virtualization allows ICS administrators to test new patches or software updates (B) in a controlled, isolated environment before

deploying them on production systems. This minimizes operational risk and downtime.
Virtualization does not inherently increase networking speed (A) or processing speed (D).
Sharing hardware resources across different security levels (C) is generally discouraged due to security risks.
GICSP highlights virtualization as a valuable tool for safe testing and development in ICS environments.
