- A. VMs are automatically deployed in a gateway subnet
- **B. VMs are not allowed in a gateway subnet**
- C. VMs can be deployed in a gateway subnet only after you deploy the VPN Gateway
- D. VMs are required in a gateway subnet

Answer: B

Azure does not allow the deployment of virtual machines (VMs) in a gateway subnet. The gateway subnet is specifically reserved for Azure VPN Gateway or ExpressRoute Gateway instances, and deploying other resources in it can cause gateway deployment or operation failures.

NEW QUESTION # 25

A Linux server was deployed in a protected subnet with a dynamic IP address. A FortiGate VM in the internal subnet provides traffic filtering to it, and you must implement a firewall policy using the IP address of the Linux server.

Which feature could help integrate FortiGate using Linux server tags?

- **A. Software-defined network (SDN) connector**
- B. Microsoft Entra ID
- C. Service Fabric Cluster
- D. Targets Management

Answer: A

Explanation:

The Software-defined network (SDN) connector allows FortiGate to dynamically pull metadata such as tags, IP addresses, and resource groups from Azure resources. This enables automatic policy updates based on dynamic IP changes, such as those of a Linux server in a protected subnet.
