最新的 SAP Certified Associate C_ACDET_2506 免費考試真題 (Q37-Q42):

問題 #37

Which syntax is used for writing custom Validity Conditions?

- A. Scheme
- B. Regular expression
- C. XML
- D. Python

答案：B

解題說明：

SAP Ariba uses an expression language based on Object-Graph Navigation Language (OGNL) to define custom validity conditions on fields. Within these expressions, regular expressions (regex) are supported to perform complex pattern validations, such as

validating email formats or custom string structures. Other programming languages like Python, Scheme, or XML are not supported for this purpose. The use of regular expressions within SAP Ariba's validity conditions provides powerful, flexible validation capabilities, allowing administrators to enforce data quality rules precisely at the field level, consistent with official SAP Ariba documentation on validation expressions.

問題 #38

Custom partner bundles can be leveraged to share and apply baselines in which deployment scenario?

- A. Greenfield
- B. Brownfield
- C. Grayfield
- D. Bluefield

答案： A

問題 #39

Who leads Suite Integration activities?

- A. Partner/Customer Functional Lead
- B. SAP Support
- C. SAP Deployment Lead
- D. Customer Success Manager

答案： C

解題說明：

The SAP Deployment Lead is responsible for leading Suite Integration activities across SAP Ariba solutions.

This role acts as the primary coordinator and facilitator for integration efforts, ensuring smooth data flow, process alignment, and technical synchronization between sourcing, procurement, contracts, and other modules in the Ariba suite. The Deployment Lead works closely with the customer's functional teams, partners, and technical specialists to manage integration scope, timelines, and troubleshooting.

SAP Support typically provides post-go-live assistance but does not lead integration planning. Functional leads focus on configuration and business processes but lack overarching integration responsibility. Customer Success Managers focus on adoption and satisfaction rather than technical integration.

Therefore, the Deployment Lead role is critical for coordinating complex multi-solution projects and ensuring a unified suite experience.

問題 #40

Custom partner bundles can be leveraged to share and apply baselines in which deployment scenario?

- A. Greenfield
- B. Brownfield
- C. Grayfield
- D. Bluefield

答案： A

解題說明：

Custom partner bundles are predefined baseline configurations provided by SAP or implementation partners and are primarily used in Greenfield deployments, where a new SAP Ariba solution is being implemented from scratch. These bundles help accelerate deployment by applying standard best-practice settings and templates as a starting point in the Test environment.

In Bluefield or Brownfield deployments, which involve migration or upgrade of existing systems, incremental or selective configuration migration is more typical, and partner bundles are less relevant. Grayfield is not a recognized SAP Ariba deployment scenario.

Using partner bundles in Greenfield supports standardized setups and reduces manual configuration errors early in the project lifecycle, enabling faster time to value.

問題 #41

You have defined a custom field to have a default value based on another field. You have verified that the defaulting happens correctly the first time. However, when the dependent field change value, your custom field does not change. What scenarios could cause this? Note: There are 3 correct answers to this question.

- A. The custom field has the property Lock Initial value enabled, which prohibits a field to be changed once it's set
- B. Your dependent field does not have the property Refresh screen on value change enabled
- C. Your custom field has the property Respect User Value enabled, and the user has manually entered another value into the field
- D. The defaulting Expression sets a value that violates the custom field Validity Condition
- E. The parameter Application.Base.RecomputeValueOnFieldChange is not enabled

答案：A,B,C
