Palo Alto Networks Cloud Security Professional Sample Questions (Q13-Q18):

NEW QUESTION # 13

Which option identifies the Prisma Cloud Compute Edition?

- A. Plugin to Prisma Cloud
- **B. Downloadable, self-hosted software**
- C. Package installed with APT
- D. Software-as-a-Service (SaaS)

Answer: B

Explanation:

The Prisma Cloud Compute Edition is identified as B. Downloadable, self-hosted software. This option indicates that Prisma Cloud Compute Edition is a solution that organizations can deploy within their own infrastructure, providing them with control over the installation, configuration, and management of the security platform.

NEW QUESTION # 14

A customer has serverless functions that are deployed in multiple clouds.

Which serverless cloud provider is covered by "overly permissive service access" compliance check?

- A. GCP
- **B. AWS**
- C. Azure
- D. Alibaba

Answer: B

Explanation:

Reference: <https://docs.paloaltonetworks.com/prisma/prisma-cloud/prisma-cloud-admin-compute/compliance/serverless.html>

The serverless cloud provider covered by the "overly permissive service access" compliance check is AWS (Amazon Web Services). AWS Lambda, which is the serverless computing platform provided by AWS, may have functions that are assigned more permissions than they require to perform their operations, leading to security risks.

In the context of CSPM tools, such as Prisma Cloud, checks for overly permissive service access would typically include examining the policies attached to AWS Lambda functions to ensure that they adhere to the principle of least privilege. Such checks help identify and rectify overly broad permissions that could potentially be exploited by attackers.

The reference for this can be found in AWS best practices for Lambda security, which emphasize the importance of granting minimal privileges necessary for the Lambda function to perform its tasks, thereby reducing the potential attack surface.

NEW QUESTION # 15

What are the three states of the Container Runtime Model? (Choose three.)

- A. Learning
- B. Running
- C. Initiating
- D. Active
- E. Archived

Answer: A,D,E

Explanation:

The Container Runtime Model in Prisma Cloud typically includes states such as Learning, Active, and Archived. The Learning state is where Prisma Cloud observes container behaviors to understand normal operations and establish a baseline. During this phase, the system is not actively enforcing security policies but is learning the typical behaviors and patterns of container activity. The Active state is where the system actively enforces security policies based on the learned behaviors and detected anomalies. Containers that exhibit suspicious or malicious activity that deviates from the baseline may trigger alerts or actions based on configured policies. The Archived state refers to containers that are no longer active but whose data and activity logs are retained for historical analysis or compliance purposes.

NEW QUESTION # 16

What happens when a role is deleted in Prisma Cloud?

- A. The access key associated with that role is automatically deleted.
- B. Any integrations that use the access key to make calls to Prisma Cloud will stop working.
- C. Any user who uses that key will be deleted.
- D. The users associated with that role will be deleted.

Answer: A

Explanation:

When you create an access key, the key is tied to the role with which you logged in and if you delete the role, the access key is automatically deleted. <https://docs.paloaltonetworks.com/prisma/prisma-cloud/prisma-cloud-admin/manage-prisma-cloud-administrators/create-access-keys>

NEW QUESTION # 17

When configuring SSO how many IdP providers can be enabled for all the cloud accounts monitored by Prisma Cloud?

- A. 0
- B. 1
- C. 2
- D. 3

Answer: A

Explanation:

Prisma Cloud supports configuring Single Sign-On (SSO) with Identity Providers (IdPs) to streamline user authentication processes. However, for all the cloud accounts monitored by Prisma Cloud, only one IdP provider can be enabled at any given time. This limitation ensures a unified authentication mechanism across the platform, reducing complexity and potential security risks associated with managing multiple IdP configurations.
