CompTIA Cloud Essentials+ Certification Exam Sample Questions (Q294-Q299):

NEW QUESTION # 294
A company wants to process a batch job in a faster, cost-effective manner. Which of the following is the BEST solution?

- A. Increase CPU usage.
- B. Add storage.
- C. Implement right-sizing.
- D. Utilize spot instances.

Answer: D

Explanation:
Spot instances are cloud computing resources that are available at a lower price than the regular on-demand price, but can be interrupted and reclaimed by the cloud provider at any time1. Spot instances are ideal for batch jobs that have flexible completion times and can tolerate failures, as they can provide faster and cheaper computing power than regular instances2. Spot instances can also be combined with other pricing options, such as on-demand or reserved instances, to optimize the performance and cost of batch jobs3.
Implementing right-sizing is a technique of adjusting the size and type of cloud resources to match the actual needs and usage patterns of an application4. Right-sizing can help reduce the cost and improve the efficiency of cloud resources, but it does not necessarily make the batch job faster, as it depends on the workload and demand of the job.
Increasing CPU usage is a measure of how much processing power is being consumed by an application or a system. Increasing CPU usage can make the batch job faster, but it can also increase the cost and risk of overloading the system. Increasing CPU usage is not a solution by itself, but rather a consequence of using more or larger cloud resources.
Adding storage is a process of increasing the amount or capacity of data that can be stored in the cloud. Adding storage can help store more data or backup data for the batch job, but it does not directly affect the speed or cost of the batch job, as it depends on the type and performance of the storage service. NEW QUESTION # 295
A large online car retailer needs to leverage the public cloud to host photos that must be accessible from anywhere and available at anytime. Which of the following cloud storage types would be cost-effective and meet the requirements?

- A. Cold storage
- B. File storage
- C. Object storage
- D. Block storage

Answer: C

Explanation:
Object storage is a cloud storage type that would be cost-effective and meet the requirements of a large online car retailer that needs to host photos that must be accessible from anywhere and available at anytime. Object storage is a type of cloud storage that stores data as objects, which consist of data, metadata, and a unique identifier. Object storage is ideal for storing large amounts of unstructured data, such as photos, videos, audio, documents, and web pages.

NEW QUESTION # 296
A company is considering migrating to a cloud provider. The IT department has produced the following checklist of features that will

satisfy the RFP requirements:
Ability to customize internally developed applications Ability to patch internally developed applications.
Which of the following should the company do?

- A. Migrate critical applications to a SaaS model, and keep non-critical applications in-house.
- B. Deploy non-critical applications to a PaaS model.
- C. Install a thick client to provide the required functionality, regardless of the cloud model.
- D. Implement a community IaaS solution.

Answer: D

NEW QUESTION # 297
Which of the following is an advantage of cloud computing for an organization?

- A. Increased scalability to meet usage demands
- B. Increased security of applications and data due to virtualization
- C. Increased internal focus on IT when hosting with proven providers
- D. Decreased downtime due to increased control over hosted servers

Answer: A

NEW QUESTION # 298
A cloud administrator notices users call to report application performance degradation between 1:00 p.m. and 3:00 p.m. every day.
Which of the following is the BEST option for the administrator to configure?

- A. Right-sizing
- B. Auto-scaling
- C. Block storage
- D. Locality

Answer: B

Explanation:
Auto-scaling is a feature that helps to adjust the capacity of a system automatically based on its current demand. The goal of auto-scaling is to maintain the performance of the system and to reduce costs by only using the resources that are actually needed1. If the cloud administrator configures auto-scaling for the application, the system can scale out (add more instances) during the peak hours of 1:00 p.m. and 3:00 p.m. every day, and scale in (remove instances) when the demand is low. This way, the application can handle the increased workload without degrading its performance, and the users can have a better experience.
