EMC Dell Information Storage and Management Foundations v2 Exam Sample Questions (Q17-Q22):

NEW QUESTION # 17
Question:
What is a key advantage of cloning a VM?

- A. Ability to run new VMs simultaneously with the same IP address
- B. Eliminates the need to create multiple snapshots for a VM
- C. Saves time when creating multiple identical copies of a VM
- D. Improves the performance of existing and new VMs

Answer: C

Explanation:
VM cloning allows administrators to create exact copies of a virtual machine quickly.
Saves time compared to manually configuring new VMs.
Useful for testing, development, and scaling environments.
Each clone can be independently modified after creation.
* Same IP address is typically not the case (clones get unique addresses).
* Snapshots provide rollback points, not full VM clones.
* Performance does not improve because of cloning itself.

NEW QUESTION # 18
Question:
What is the main advantage of a write-through operation in cache write I/O operations?

- A. No impact to host I/O performance
- B. Enhanced data security
- C. Reduced write-response time
- D. Low risk of data loss

Answer: B

Explanation:
In write-through caching, data is written simultaneously to both the cache and the underlying disk. This ensures data integrity because the write is not acknowledged until it's safely written to the disk.
* Write-back caching offers reduced latency but increases risk of data loss if cache is lost.
* Write-through trades speed for security, offering enhanced data security and reducing the risk of data loss during power failures.

NEW QUESTION # 19
Question:
Which operations management process is responsible for maintaining information about configuration items (CIs)?

- A. Performance management
- B. Change management
- C. Configuration management
- D. Capacity management

Answer: C

Explanation:

Configuration Management is the process that ensures all configuration items (CIs) are identified, tracked, and maintained throughout their lifecycle. It maintains a Configuration Management Database (CMDB) that records the relationships and configurations of various components in the IT environment.

NEW QUESTION # 20

Question:

A backup array was able to achieve a 30:1 reduction by finding multiple copies of the same data. Which method was used in this scenario?

- **A. Data deduplication**
- B. Data replication
- C. Data compression
- D. Data encryption

Answer: A

Explanation:

Data deduplication is a technique that eliminates redundant copies of data, storing only unique instances.

When multiple copies of the same data are found, deduplication replaces them with references to a single stored copy, significantly reducing storage requirements.

* Data replication:Involves copying data to another location for redundancy, not reducing storage size.
* Data encryption:Secures data but doesn't affect storage size.
* Data compression:Reduces data size by encoding information more efficiently but doesn't eliminate duplicates.

NEW QUESTION # 21

Question:

A company needs to ensure high availability for its applications and minimize downtime in case of a disk failure. The current storage configuration is a RAID 0 array with SSDs. Which RAID level is most cost effective and would provide the necessary data protection without significant performance degradation?

- **A. Migrate to a RAID 5 array with SSDs for parity-based protection**
- B. Implement a RAID 1 array with SSDs for disk mirroring
- C. Maintain the existing RAID 0 configuration with SSDs
- D. Upgrade to a RAID 6 array with SSDs for dual parity protection

Answer: A
