## **Amazon AWS Certified Solutions Architect - Associate (SAA-C03) Sample Questions (Q463-Q468):**

### **NEW QUESTION # 463**

A Solutions Architect is designing a solution to store a large quantity of event data in Amazon S3.

The Architect anticipates that the workload will consistently exceed 100 requests each second.

What should the Architect do in Amazon S3 to optimize performance?

- A. Use Amazon S3 Transfer Acceleration.
- B. Randomize the key name suffix.
- C. Store the event data in separate buckets.
- D. Randomize a key name prefix.

**Answer: D**

Explanation:

### **NEW QUESTION # 464**

A company has an automobile sales website that stores its listings in a database on Amazon RDS. When an automobile is sold the listing needs to be removed from the website and the data must be sent to multiple target systems.

Which design should a solutions architect recommend?

- A. Subscribe to an RDS event notification and send an Amazon Simple Notification Service (Amazon SNS) topic fanned out to multiple Amazon Simple Queue Service (Amazon SQS) queues. Use AWS Lambda functions to update the targets.
- B. Subscribe to an RDS event notification and send an Amazon Simple Queue Service (Amazon SQS) queue fanned out to multiple Amazon Simple Notification Service (Amazon SNS) topics. Use AWS Lambda functions to update the targets.
- C. Create an AWS Lambda function triggered when the database on Amazon RDS is updated to send the information to an Amazon Simple Queue Service (Amazon SQS) queue for the targets to consume.
- D. Create an AWS Lambda function triggered when the database on Amazon RDS is updated to send the information to an Amazon Simple Queue Service (Amazon SQS) FIFO queue for the targets to consume.

**Answer: A**

Explanation:

### **NEW QUESTION # 465**

An application has performance issues due to increased demand. The demand is on read-only historical records in Amazon RDS using custom queries. The company wants improved performance without changing database structure and with minimal management overhead.

Which approach meets the requirement?

- A. Deploy Memcached on EC2 and cache data.
- B. Deploy DynamoDB Accelerator (DAX) on Amazon RDS.
- C. Deploy DynamoDB and move all data.
- D. Deploy Amazon ElastiCache (Redis OSS) and cache application data.

**Answer: D**

Explanation:

Amazon ElastiCache (Redis OSS) provides an in-memory cache that drastically improves read performance with minimal operational overhead.

It integrates easily with RDS and does not require schema or database changes.

EC2-based caching (Option C) increases management overhead.

DAX (Option D) accelerates DynamoDB only, not RDS.

Moving to DynamoDB (Option A) requires complete application and schema redesign.

**NEW QUESTION # 466**

An online video game company must maintain ultra-low latency for its game servers. The game servers run on Amazon EC2 instances. The company needs a solution that can handle millions of UDP internet traffic requests each second.

Which solution will meet these requirements MOST cost-effectively?

- A. Configure a Network Load Balancer with the required protocol and ports for the internet traffic. Specify the EC2 instances as the targets.
- B. Configure an Application Load Balancer with the required protocol and ports for the internet traffic. Specify the EC2 instances as the targets.
- C. Launch an identical set of game servers on EC2 instances in separate AWS Regions. Route internet traffic to both sets of EC2 instances.
- D. Configure a Gateway Load Balancer for the internet traffic. Specify the EC2 instances as the targets.

**Answer: A**

Explanation:

The most cost-effective solution for the online video game company is to configure a Network Load Balancer with the required protocol and ports for the internet traffic and specify the EC2 instances as the targets. This solution will enable the company to handle millions of UDP requests per second with ultra-low latency and high performance.

A Network Load Balancer is a type of Elastic Load Balancing that operates at the connection level (Layer 4) and routes traffic to targets (EC2 instances, microservices, or containers) within Amazon VPC based on IP protocol data. A Network Load Balancer is ideal for load balancing of both TCP and UDP traffic, as it is capable of handling millions of requests per second while maintaining high throughput at ultra-low latency. A Network Load Balancer also preserves the source IP address of the clients to the back-end applications, which can be useful for logging or security purposes.

**NEW QUESTION # 467**

How can you secure data at rest on an EBS volume?

- A. Use an encrypted file system on top of the EBS volume.
- B. Write the data randomly instead of sequentially.
- C. Create an IAM policy that restricts read and write access to the volume.
- D. Attach the volume to an instance using EC2's SSL interface.
- E. Encrypt the volume using the 53 server-side encryption service.

**Answer: A**
