ISACA Certified Cybersecurity Operations Analyst Sample Questions (Q117-Q122):

NEW QUESTION # 117

Which of the following is a type of middleware used to manage distributed transactions?

- A. Message-oriented middleware
- **B. Transaction processing monitor**
- C. Remote procedure call
- D. Object request broker

Answer: B

Explanation:

A Transaction Processing Monitor (TPM) is a type of middleware that manages and coordinates distributed transactions across multiple systems.

* Core Functionality: Ensures data consistency and integrity during complex transactions that span various databases or applications.

* Transactional Integrity: Provides rollback and commit capabilities in case of errors or failures.

* Common Use Cases: Banking systems, online booking platforms, and financial applications.

Incorrect Options:

* A. Message-oriented middleware: Primarily used for asynchronous message processing, not transaction management.

* C. Remote procedure call (RPC): Facilitates communication between systems but does not manage transactions.

* D. Object request broker: Manages object communication but lacks transaction processing capabilities.

Exact Extract from CCOA Official Review Manual, 1st Edition:

Refer to Chapter 7, Section "Middleware Components," Subsection "Transaction Processing Middleware" - TPMs handle distributed transactions to ensure consistency across various systems.

NEW QUESTION # 118

Which of the following is a control message associated with the Internet Control Message Protocol (ICMP)?

- A. Webserver is available.
- **B. Destination is unreachable.**
- C. 404 is not found.
- D. Transport Layer Security (TLS) protocol version is unsupported.

Answer: B

Explanation:

The Internet Control Message Protocol (ICMP) is used for error reporting and diagnostics in IP networks.

- * Control Messages: ICMP messages inform the sender about network issues, such as:
- * Destination Unreachable: Indicates that the packet could not reach the intended destination.
- * Echo Request/Reply: Used in ping to test connectivity.
- * Time Exceeded: Indicates that a packet's TTL (Time to Live) has expired.
- * Common Usage: Troubleshooting network issues (e.g., ping and traceroute).

Other options analysis:

- * A. TLS protocol version unsupported: Related to SSL/TLS, not ICMP.
- * C. 404 not found: An HTTP status code, unrelated to ICMP.
- * D. Webserver is available: A general statement, not an ICMP message.

CCOA Official Review Manual, 1st Edition References:

- * Chapter 4: Network Protocols and ICMP: Discusses ICMP control messages.
- * Chapter 7: Network Troubleshooting Techniques: Explains ICMP's role in diagnostics.

NEW QUESTION # 119

A password is an example of which type of authentication factor?

- A. Something you are
- B. Something you do
- **C. Something you know**
- D. Something you have

Answer: C

Explanation:

A password falls under the authentication factor of "something you know".

- * Knowledge-Based Authentication: The user must remember and enter a secret (password or PIN) to gain access.
- * Common Factor: Widely used in traditional login systems.
- * Security Concerns: Prone to theft, phishing, and brute-force attacks if not combined with additional factors (like MFA).

Incorrect Options:

- * A. Something you do: Refers to behavioral biometrics, like typing patterns.
- * C. Something you are: Refers to biometric data, such as fingerprints or iris scans.
- * D. Something you have: Refers to physical tokens or devices, like a smart card.

Exact Extract from CCOA Official Review Manual, 1st Edition:

Refer to Chapter 4, Section "Authentication Factors," Subsection "Knowledge-Based Methods" - Passwords are considered "something you know" in authentication.

NEW QUESTION # 120

Multi-factor authentication (MFA) BEST protects against which of the following attack vectors?

- A. Malware
- B. Ransomware
- **C. Compromised credentials**
- D. Social engineering

Answer: C

Explanation:

Multi-factor authentication (MFA) significantly mitigates risks associated with compromised credentials by requiring multiple verification factors, such as:

- * Something you know (password)
- * Something you have (authenticator app or token)
- * Something you are (biometric data)

Even if attackers obtain the password, they would still need additional factors, making unauthorized access far more challenging.

Incorrect Options:

- * B. Social engineering: MFA does not directly protect against sophisticated social engineering attacks where users are tricked into giving away all factors.
 - * C. Malware: MFA does not prevent malware infections on the device.
 - * D. Ransomware: Ransomware attacks typically bypass authentication mechanisms.
- Exact Extract from CCOA Official Review Manual, 1st Edition:
Refer to Chapter 4, Section "Identity and Access Management," Subsection "Multi-Factor Authentication" - MFA specifically addresses the risk of compromised credentials.

NEW QUESTION # 121

An organization's financial data was compromised and posted online. The forensics review confirms proper access rights and encryption of the database at the host site. A lack of which of the following controls MOST likely caused the exposure?

- A. Continual backups
- B. Properly configured firewall
- C. Multi-factor authentication (MFA)
- D. Encryption of data in transit

Answer: C

Explanation:

The compromise occurred despite encryption and proper access rights, indicating that the attacker likely gained access through compromised credentials. MFA would mitigate this by:

- * Adding a Layer of Security: Even if credentials are stolen, the attacker would also need the second factor (e.g., OTP).
- * Account Compromise Prevention: Prevents unauthorized access even if username and password are known.
- * Insufficient Authentication: The absence of MFA often leaves systems vulnerable to credential-based attacks.

Other options analysis:

- * A. Continual backups: Addresses data loss, not unauthorized access.
- * C. Encryption in transit: Encryption was already implemented.
- * D. Configured firewall: Helps with network security, not authentication.

CCOA Official Review Manual, 1st Edition References:

- * Chapter 7: Access Management and Authentication: Discusses the critical role of MFA in preventing unauthorized access.
- * Chapter 9: Identity and Access Control: Highlights how MFA reduces the risk of data exposure.
