社会に入ったあなたが勉強する時間は少なくなりました。それでも、引き続き勉強する必要があります。CyberArk CPC-CDE-RECERT問題集は便利で、使い安くて、最も大切なのは時間を節約できます。CyberArk

CPC-CDE-RECERT問題集を勉強したら、順調にCPC-CDE-RECERT認定試験資格証明書を手に入れます。

CyberArk CDE-CPC Recertification 認定 CPC-CDE-RECERT 試験問題 (Q62-Q67):

質問 # 62

When installing the PSM and CPM components on the same Privilege Cloud Connector, what should you consider when hardening?

- A. They can only be installed on the same Privilege Cloud Connector when installed 'in Domain'.
- **B. PSM settings override the CPM settings when referring to the same parameter.**
- C. They can only be installed on the same Privilege Cloud Connector when installed 'out of Domain'.
- D. CPM settings override the PSM settings when referring to the same parameter

正解: B

解説:

When installing the PSM and CPM components on the same Privilege Cloud Connector and considering the hardening process, it's important to note that PSM settings override the CPM settings when referring to the same parameter. This hierarchy is crucial in ensuring that the more stringent security settings required by PSM, which typically handles direct interaction with end-user sessions, take precedence over CPM settings.

This setup helps maintain robust security practices by applying the most restrictive configuration where conflicts occur.

質問 # 63

What must be done to configure the syslog server IP address(es) for SIEM integration? (Choose 2.)

- A. Update the vault.ini file with the correct syslog server IP address.
- B. Update the syslog server IP address through the Privilege Cloud Portal.
- **C. Configure the Secure Tunnel for SIEM integration.**
- D. Update the DBPARM.ini file with the correct syslog server IP address.
- **E. Submit a service request to CyberArk Support.**

正解: C、E

解説:

<https://docs.cyberark.com/privilege-cloud-shared-services/Latest/en/Content/Privilege%20Cloud/privCloud-connect-siem.htm>

質問 # 64

What are the basic network requirements to deploy a CPM server?

- A. Port UDP/1858 to the Privilege Cloud Vault service backend and all required ports to the targets and Port 3389 to the PSM
- B. Port 1858 only
- **C. Port 1858 to the Privilege Cloud Vault service backend and Port 443 to the Privilege Cloud Portal**
- D. any ports to the Privilege Cloud Vault service backend

正解: C

解説:

The basic network requirements to deploy a CyberArk Privilege Management Central Policy Manager (CPM) server include Port 1858 to the Privilege Cloud Vault service backend and Port 443 to the Privilege Cloud Portal. Port 1858 is necessary for communication with the CyberArk Vault, facilitating essential interactions like password retrieval and updates. Port 443 is required for secure web traffic to and from the Privilege Cloud Portal, ensuring that all management tasks performed through the web interface are secure and encrypted. These ports must be properly configured to allow for the efficient and secure operation of the CPM within the Privilege Cloud infrastructure.

質問 # 65

Your customer recently merged with a smaller organization. The customer's connector has no network connectivity to the smaller

organization's infrastructure. You need to map LDAP users from both your customer and the smaller organization. How is this achieved?

- **A. Deploy Identity Connectors in the newly acquired infrastructure and create user mappings.**
- B. Create the required users in one directory and configure the Identity Connector to read that directory, as there can only be one Identity Connector.
- C. Create mappings for both directories from the original Identity Connector.
- D. Switch all users to SAML authentication as there can only be one Identity Connector.

正解: A

解説:

To map LDAP users from both your customer and the smaller organization they have merged with, especially when there is no network connectivity between the two infrastructures, the best approach is to:

* Deploy Identity Connectors in the newly acquired infrastructure and create user mappings (Option C). This involves setting up additional Identity Connectors within the smaller organization's network. These connectors will facilitate the integration of user directories from both organizations into the customer's Privilege Cloud environment.

Reference: CyberArk documentation on Identity Connectors often outlines the capability of deploying multiple connectors to manage different user directories, especially useful in scenarios involving mergers or acquisitions where separate infrastructures need integration.

質問 # 66

When using Connector Management, how do you configure a DR CPM in Privilege Cloud shared services?
(Choose two.)

- A. Stop the CyberArk Password Manager service and set the startup type to Automatic.
- **B. Stop the CyberArk Password Manager service and set the startup type to Manual.**
- C. When prompted for the Vault administrator credentials on the installation windows, leave it blank and proceed.
- **D. When prompted to select the CPM mode, select Passive.**
- E. When prompted for the Vault IP address on the installation windows, leave it blank and proceed.

正解: B、D

解説:

CyberArk's official DR CPM procedure for Privilege Cloud (shared services) describes two key actions in this flow:

* During installation (Connector Management): When prompted to select the CPM mode, choose Passive.

* After installation (configuration step): Stop the CyberArk Password Manager service and set its startup type to Manual. These map directly to answers C and A.
