問題 #34

What is required to centrally administer a user's master record using Central User Administration? Note:

There are 3 correct answers to this question.

- A. An RFC destination to the target system
- B. An RFC destination to the target client
- C. An existing master record in the target client for the user
- D. An ALE distribution model
- E. An entry in transaction BD54 for the child system

答案: A,D,E

問題 #35

Which archiving objects are relevant for archiving change documents for user master records? Note: There are 2 correct answers to this question.

- A. US_PASS
- B. US_PROF
- C. US_USER
- D. US_AUTH

答案: A,C

解題說明:

In SAP systems, archiving change documents for user master records involves specific archiving objects to manage historical data efficiently. The archiving object US_PASS is used to archive changes related to user passwords, such as password resets or updates, which are critical for tracking user account modifications.

Similarly, US_USER is used to archive changes to user master records, including details like user IDs, names, and group assignments, ensuring a comprehensive record of user profile modifications. These objects allow administrators to store historical data securely while freeing up system resources. In contrast, US_AUTH is related to authorization assignments, not user master record changes, and US_PROF deals with profile assignments, which are separate from user master data. By using US_PASS and US_USER, SAP ensures that changes to sensitive user information are preserved for audit and compliance purposes, supporting security governance in large-scale SAP environments. This archiving process helps maintain system performance while retaining essential historical data for regulatory and forensic analysis.

問題 #38

An authorization based on what object is required for trusted system access to an SAP Fiori back-end server?

- A. S_RFCACL
- B. S_RFC
- C. S_SERVICE
- D. S_START

答案： A

解題說明：

For trusted system access to an SAP Fiori back-end server, the authorization object S_RFCACL is required.

S_RFCACL (RFC Authorization for Trusted Systems) controls access in trusted RFC (Remote Function Call) connections, which are used to establish secure communication between the Fiori front-end server and the back-end server. This object ensures that only authorized systems or users can execute RFC calls in a trusted relationship, verifying the calling system's identity and the user's permissions. It is critical for securing Fiori app access, as these apps rely on RFC connections to retrieve data from the back-end. S_START is used for starting Fiori apps, S_SERVICE governs OData service access, and S_RFC controls general RFC access but lacks the trusted system specificity of S_RFCACL. By requiring S_RFCACL, SAP ensures that trusted connections are tightly controlled, preventing unauthorized access and maintaining the integrity of Fiori back-end interactions in SAP S/4HANA systems.
