We are so honored and pleased to be able to read our detailed introduction and we will try our best to enable you a better understanding of our AP-219 Study Materials better.

Salesforce Order Management Administrator Accredited Professional Sample Questions (Q46-Q51):

NEW QUESTION # 46

An administrator is attempting to deploy aChange Set from a development org to a test org but the test org is not available in the list of target organizations. What are two reasons that could cause this issue?

- A. The components in the Change set could not be found within the test org
- B. ChangeSets can only be deployed from a sandbox org to a production org, not another sandbox org.
- C. The development org and test org are not associated with the same production org.
- D. The development org has not been approved to upload Change Sets from within the test org

Answer: C,D

Explanation:
Two reasons that could cause the issue of not being able to deploy a Change Set from a development org to a test org are:
The development org has not been approved to upload Change Sets from within the test org. To deploy ChangeSets between two sandbox orgs, the administrator needs to establish a deployment connection between them. A deployment connection allows one org to send outbound Change Sets and another org to receive inbound Change Sets. The administrator can create a deployment connection request from the development org and approve it from the test org.
The development org and test org are not associated with the same production org. To deploy Change Sets between two sandbox orgs, they must be linked to the same production org. A production org is an org that contains live data and business processes. A sandbox org is a copy of a production org that is used for development, testing, or training purposes. Sandbox orgs inherit the deployment connections of their source production orgs. Reference: Deploy Using Change Sets, Deploy a Change Set

NEW QUESTION # 47

What are two ways an administrator can query Order Summaries using APIs in Workbench?

- A. Composite API
- B. Apex API
- C. Connect API
- D. Platform API
- E. Invocable API

Answer: A,D

Explanation:
Two ways that an administrator can query Order Summaries using APIs in Workbench are:
Platform API. The Platform API is a set of REST and SOAP APIs that allow developers to access data and functionality in Salesforce from external systems. The Platform API includes various resources and operations for querying, creating, updating, or deleting records in Salesforce, such as Order Summaries. The administrator can use the Platform API in Workbench byselecting the REST Explorer or SOAP Explorer tabs, and entering the appropriate request URL and parameters.
Composite API. The Composite API is a type of REST API that allows developers to execute multiple subrequests in a single HTTP request. The Composite API includes various resources and operations for batching, tree, sObject collections, or transactions in Salesforce, such as Order Summaries. The administrator can use the Composite API in Workbench by selecting the REST Explorer tab, and entering theappropriate request URL and JSON body.

NEW QUESTION # 48

How can an administrator add visibility rules for the buttons in the Highlights Panel on the Order Summary record page?

- A. Create a custom Highlights Panel component
- B. Modify the Lightning Record Page Highlights Panel using Dynamic Actions
- C. Modify the visibility rules of theHighlights Panel Actions in the page layout
- D. Navigate to the Order Summary object in Setup and modify the Highlights Panel visibility rules

Answer: B

Explanation:
Dynamic Actions allow an administrator to add visibility rules for the buttons in the Highlights Panel on the Lightning Record Page.
Dynamic Actions let you configure when and where actions appear on a record page based on criteria such asrecord field values,

user permissions, or device type.

NEW QUESTION # 49

Which two order management objects have their s set to hidden by default?
(choose 2)

- **A. Sales Location**
- B. Accounts
- C. Fulfillment orders
- **D. Order Delivery Method**
- E. Locations

Answer: A,D

NEW QUESTION # 50

A customer orders 10 products. The products must be shipped to three different locations. Two of the orders are fulfilled at the same location. How many Fulfillment Orders would be created for this order?

- **A. One Fulfillment Order pet destination, totaling 3**
- B. One Fulfillment Order
- C. One Fulfilment Order per item in the order, totaling 10
- D. One Fulfillment Order per Fulfillment Location, totaling 2

Answer: A

Explanation:
The number of Fulfillment Orders that would be created for this order is one per destination, totaling 3. A Fulfillment Order is a record that represents a group of products in an order that are fulfilled together from the same location. A Fulfillment Order has a lookup relationship to the Order Summary object, and it contains information such as the fulfillment location, delivery method, status, etc. The number of Fulfillment Orders created depends on three factors: Fulfillment Location, Delivery Method and Recipient Address. These factors determine how the Order Items are grouped and allocated to Fulfillment Orders based on routing rules and inventory availability. In this case, since the products must be shipped to three different locations, three Fulfillment Orders are created for each destination. Verified Reference:https://help.salesforce.com/s/articleView?
