## NCP-MCA: Online Nutanix Certified Professional - Multicloud Automation (NCP-MCA 6.10) Training - Free PDF Quiz 2026 Unparalleled NCP-MCA

Perhaps you worry about that you have difficulty in understanding our NCP-MCA training questions. Frankly speaking, we have taken all your worries into account. Firstly, all knowledge of the NCP-MCA exam materials have been simplified a lot. Also, we have tested many volunteers who can prove that after studying our NCP-MCA Exam Questions for 20 to 30 hours, it is easy to pass the exam. The results show that our NCP-MCA study materials are easy for them to understand. In addition, they all enjoy learning on our NCP-MCA practice exam study materials.

### Nutanix Certified Professional - Multicloud Automation (NCP-MCA 6.10) Sample Questions (Q84-Q89):

#### NEW QUESTION # 84

An application team wants faster releases and starts an initiative to automate the entire database and application deployments.

The current manual process involves:

- Creating virtual machines to host the databases and applications
- Allocate right amount of storage for the database and applications
- Deploy database software and create database
- Schedule backup and recovery process for the database
- Deploy applications

How can application releases be repeatedly deployed in the least amount of time?

- A. Deploy databases through Era and create a Calm blueprint to automate application deployment
- B. Deploy databases manually and create a Calm blueprint to automate application deployment
- C. Create a Calm blueprint deploying applications and calling Era APIs to automate database deployments
- D. Create a Calm blueprint calling Calm APIs for both database and applications deployments

**Answer: C**

Explanation:

The best way to automate the entire database and application deployments is to use a combination of Nutanix Calm and Nutanix Era. Nutanix Calm is a multicloud automation platform that allows you to create blueprints to deploy and manage infrastructure and applications across different cloud environments. Nutanix Era is a database management platform that allows you to provision, clone, patch, refresh, and restore databases in a simplified and automated way. By creating a Calm blueprint that deploys applications and calls Era APIs to automate database deployments, you can achieve faster and consistent releases, as well as reduce the manual effort and complexity involved in the process. You can also leverage the features of Calm and Era, such as self-service, governance, showback, backup, and recovery, to enhance the efficiency and security of your deployments. Reference:

#### NEW QUESTION # 85

An administrator needs to restore a snapshot from a VM running in AWS that was created with a single VM blueprint. Within which Calm tab should the administrator perform this task?

- A. Snapshots
- B. Recovery
- C. Manage

**Answer: A**

Explanation:

According to the Nutanix Calm documentation<sup>1</sup>, the Snapshots tab allows the administrator to view, create, and restore snapshots of the VMs that are part of a blueprint. The Manage tab only shows the status and actions of the blueprint, and the Recovery tab is

used for disaster recovery operations<sup>2</sup>. References:

### NEW QUESTION # 86

The administrator receives the below error when deleting an Application from a Self-Service (formerly Calm) blueprint for a Linux VM when using a custom script as part of the Delete system action:

```
script execution has failed with error dial tcp: lookup dummy on <dns_ip_in_pc>:53: server
misbehaving.
NUTANIX
```

Which two steps should the administrator take to delete the deployment? (Choose two.)

- A. Perform a Soft Delete
- B. Perform a Delete
- C. Perform a Stop
- D. Manually delete the VM

**Answer: C,D**

Explanation:

The error indicates that there is an issue with DNS resolution while executing the delete script. To resolve this and successfully delete the deployment, the administrator can:

Perform a Stop: Stop the application or VM to ensure that no processes are actively using the resources. This might resolve any temporary network or DNS issues.

Manually delete the VM: If stopping the application does not resolve the issue, manually deleting the VM from the Prism Central or the respective hypervisor management console is necessary. This will bypass the script error.

### NEW QUESTION # 87

An administrator would like to share an existing published Runbook across different Projects.

What must the administrator do to accomplish this task?

- A. Clone the Runbook, publish cloned Runbook to Marketplace and select Projects to share with.
- B. Re-publish Runbook as a Marketplace item and select Projects to share with.
- C. Re-publish Runbook as a Marketplace item without secret values and select Projects to share with.
- D. Clone the Runbook, publish cloned Runbook to Marketplace without secret values.

**Answer: C**

Explanation:

In Nutanix Self-Service (Calm), to share a Runbook across multiple projects, it must be published to the Marketplace.

When an administrator selects an existing Runbook and chooses the "Publish" option:

\* Secret Handling: The system strictly enforces that secrets (passwords/keys) are not published. The administrator is required to verify that no secret values are hardcoded. Any sensitive variables are stripped or must be set to runtime input during the publication process.

\* Project Selection: During the publication or approval workflow via the Marketplace Manager, the administrator configures the Project Sharing settings. This determines which projects have access to view and execute the Runbook from the Marketplace. It is not necessary to clone the Runbook first; the publication process itself creates the Marketplace entry derived from the source Runbook.

### NEW QUESTION # 88

What is the correct syntax for using a macro within a Calm blueprint?

- A. {{calm.object}}
- B. @@{calm.object}(@@)
- C. %calm.object%

- D. \$\_calm.object\_\$

**Answer: B**

Explanation:

A macro is a placeholder for a value that is resolved at runtime. Macros can be used to reference various Calm objects, such as variables, secrets, credentials, tasks, and services. The correct syntax for using a macro within a Calm blueprint is @@{calm.object}(@@, where calm.object is the name of the object to be referenced. For example, @@{username}(@@ would resolve to the value of the username variable at runtime. The other options are incorrect syntaxes for macros and would not be resolved by Calm.
