By taking the practice material designed by our specialists, and after it you'll be able to pass your exams in the first attempt. We offer a 100% guarantee of success and we are sure you will succeed.

Prep4pass gives everything you require to pass the certification exam. If you are looking for certification and are not successful, it is time for you to try what we offer.

Obviously, at certificate-qusetions.com, we give certification practice exams and exam dumps, as we think that practice exams are the most important thing an expert can do when preparing for a certification exam (in the IT certification area or otherwise).

When you start preparing for the certification exam, there are some basic but powerful methods that allow you to identify everything in your preparation. Many experts prepare the certification from books, so they are dissatisfied if unfortunately, they fail in the exam. The fact is that understanding the root of the information is only a tiny part of the preparation that most individuals have to pass the certification exams.

No one likes failure, mostly in such complex fields where certification requires a lot of research, planning and attention. A single attempt is so tough that it could even break the nerves of the students. Our exam dumps are so valid and best which will able you to

pass your NREMT 77-420 without any pain.

Smart Candidates who want to build a solid foundation in all exam topics and related technologies usually combine video lectures with study models to reap the benefits of both but there is one crucial preparation tool as often overlooked by most candidates the practice exams.

Step 2: Signup/Login to NREMT account  
Step 3: Search for EMT Certifications Exam  
Step 4: Select Date and Center of examination and confirm with payment value of \$80

## NREMT Emergency Medical Technicians Exam Sample Questions (Q26-Q31):

### NEW QUESTION # 26

A patient has facial drooping, left side paralysis, and slurred speech. The vital signs are BP 160/100, P 100, R 20, and SpO2 96% on room air. Which of the following interventions is appropriate for this patient?

- A. Protect the left arm during transport
- B. Avoid asking the patient questions due to dysphasia
- C. Place the patient in a supine position
- D. Administer oxygen at 12 LPM

**Answer: A**

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

The patient's symptoms are consistent with a stroke (CVA). Proper prehospital care focuses on maintaining airway, breathing, circulation, and protecting the affected limbs. Positioning the patient with head elevated (not supine) reduces intracranial pressure and aspiration risk.

Protecting the paralyzed side (e.g., left arm) from injury during transport is critical. EMS should still communicate with the patient - even if speech is impaired - and perform a stroke assessment using tools like Cincinnati Prehospital Stroke Scale (CPSS) or FAST.

National EMS Education Standards - Stroke Assessment Protocols

### NEW QUESTION # 27

Which of the following would potentially complicate patient care during a helicopter transport?

- A. Use of air splints to immobilize fractures
- B. Increase in the atmospheric humidity
- C. Maintaining 98% oxygen saturation
- **D. Position of the patient's head within the aircraft**

**Answer: D**

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

The position of the patient's head within the aircraft affects access to airway management and crew maneuverability. If the head is oriented away from providers or toward a non-accessible bulkhead, this can delay critical interventions (airway suctioning, ventilations).

Use of air splints, maintaining oxygen saturation, or environmental humidity are not major complications relative to physical positioning and in-cabin access limitations.

### NEW QUESTION # 28

A 67-year-old patient is sitting in the tripod position. What general impression should the EMT most strongly suspect from this patient's position?

- A. The patient is in cardiac arrest
- B. The patient has abdominal pain
- C. The patient is having a seizure
- **D. The patient has trouble breathing**

**Answer: D**

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

The tripod position- sitting upright, leaning forward, supporting the upper body with arms on knees - is a classic sign of respiratory distress. This position:

\* Maximizes diaphragmatic movement

\* Engages accessory muscles of respiration

\* Improves air exchange in patients with obstructive airway diseases (e.g., COPD, asthma) It is rarely used by patients with abdominal pain or seizures and is not associated with cardiac arrest (where unconsciousness is expected).

### NEW QUESTION # 29

Following an EMS call, any requests concerning protected health information should be directed to the

- **A. Privacy officer**
- B. Shift supervisor
- C. Quality assurance officer
- D. Receiving hospital

**Answer: A**

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

Under HIPAA (Health Insurance Portability and Accountability Act), only designated personnel are authorized to handle inquiries regarding a patient's Protected Health Information (PHI). The Privacy Officer is responsible for enforcing compliance with privacy regulations and addressing PHI access requests.

Shift supervisors or hospitals do not have the legal authority to release PHI unless specifically designated.

### NEW QUESTION # 30

A 9-year-old patient who was injured in an MCI is brought to the treatment area with a delayed triage tag. Which of the following signs or symptoms would the EMT expect to find? Select the three correct options.

- A. Respiratory rate of 16
- B. Breathing only after opening the airway
- C. Follows simple commands
- D. Mottled skin
- E. Palpable pulses being present
- F. Ability to ambulate

**Answer: C,E,F**

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

In pediatric START or JumpSTART triage, a "delayed" status is appropriate if the child is breathing adequately, has palpable pulses, and follows commands. The respiratory rate of 16 is normal for a 9-year-old, and being able to walk also supports the "delayed" tag.

"Mottled skin" and "breathing only after airway opening" would more likely lead to "immediate" or even "expectant" categories depending on associated symptoms.
