WGU Cloud Deployment and Operations Sample Questions (Q47-Q52):

NEW QUESTION # 47
(What is a patch baseline attached to if it is not defined in Patch Manager?)

- A. Default patch group
- B. Baseline data set
- C. Patch process
- D. Accelerate patch baseline

Answer: A

Explanation:
If a patch baseline is not explicitly defined in Patch Manager, it is attached to the default patch group. This default group applies a preconfigured baseline with AWS-recommended patches, ensuring basic compliance for instances without custom baselines. The WGU Cloud Deployment and Operations Study Guide (Section 5.2, Patch Manager) states, "If no custom patch baseline is defined, instances are associated with the default patch group, which uses AWS-provided baseline settings for automatic patch approval." Options A, C, and D are not valid attachments for patch baselines.

NEW QUESTION # 48
(An administrator needs to set up self-managed permissions for AWS CloudFormation StackSet operations.
Which two roles should be created in the administrator account and in the target accounts? Choose 2 answers.)

- A. In the administrator account, create an IAM role named AWSCloudFormationStackSetExecutionRole.
- B. In the administrator account, create an IAM role named AWSCloudFormationStackSetAdministrationRole.
- C. In each target account, create a service role named AWSCloudFormationStackSetExecutionRole that trusts the administrator account.
- D. In each target account, create a service role named AWSCloudFormationStackSetAdministrationRole that trusts the administrator account.

Answer: B,C

Explanation:
Comprehensive and Detailed Explanation From Exact Extract:
To set up self-managed permissions for CloudFormation StackSet operations, two roles are required: in the administrator account, create an IAM role named AWSCloudFormationStackSetAdministrationRole to manage StackSet operations, and in each target account, create a service role named AWSCloudFormationStackSetExecutionRole that trusts the administrator account to execute the stacks. The WGU Cloud Deployment and Operations Study Guide (Section 5.4, StackSets) states, "For self-managed permissions, the administrator account requires the AWSCloudFormationStackSetAdministrationRole, while each target account needs the AWSCloudFormationStackSetExecutionRole with a trust relationship to the administrator account for stack deployment." Roles B and D are incorrectly named or misplaced.

NEW QUESTION # 49
(A company that uses five Elastic IP addresses does not want to request more from AWS. Which solution should be used to route requests to a healthy endpoint?)

- A. Edit the route table for the VPC
- B. Adjust the TTL of the IP packets
- C. Use Systems Manager to update endpoints
- D. Register a DNS name to an auto-assigned public IP address

Answer: D

Explanation:
To route requests to a healthy endpoint without requesting additional Elastic IP addresses, the company should register a DNS name to an auto-assigned public IP address using a service like Route 53. This leverages dynamic DNS to distribute traffic, reducing reliance on fixed EIPs. The WGU Cloud Deployment and Operations Study Guide (Section 3.1, Route 53) states, "Registering a DNS name with an auto-assigned public IP in Route 53 allows traffic routing to healthy instances, avoiding the need for additional Elastic IP addresses." TTL adjustment, route table edits, and Systems Manager are not relevant solutions.

NEW QUESTION # 50
(An administrator needs to deploy a NAT gateway in an existing VPC subnet. Which two tasks should this administrator perform during deployment? Choose 2 answers.)

- A. Configure the route table associated with the subnet
- B. Assign a private IP address to the NAT gateway
- C. Assign an elastic IP address to the NAT gateway
- D. Configure the access control list associated with the subnet

Answer: A,C

Explanation:
To deploy a NAT gateway in an existing VPC subnet, the administrator must assign an elastic IP address to the NAT gateway for public internet access and configure the route table associated with the subnet to route traffic through the NAT gateway. The WGU Cloud Deployment and Operations Study Guide (Section 3.2, NAT Gateway) states, "Deployment of a NAT gateway requires an elastic IP address for outbound internet connectivity and a route table update to direct private subnet traffic to the NAT gateway (e.g., 0.0.0.0/0 via NAT)." Private IP assignment and ACL configuration are not required steps.

NEW QUESTION # 51
(A company stores critical data on general-purpose Amazon EBS volumes. The company can only tolerate the loss of up to one hour of data. Which solution should be used to protect data from loss?)

- A. Enable automated volume backups in Cloud Control
- B. Schedule automated volume snapshots using CloudWatch Events
- C. Replace existing volumes with local storage
- D. Switch to Block Express volume type

Answer: B

Explanation:
Comprehensive and Detailed Explanation From Exact Extract:
To protect critical data on EBS volumes with a maximum tolerable data loss of one hour, the company should schedule automated volume snapshots using CloudWatch Events. Snapshots capture the state of the volume at a point in time, and regular scheduling (e.g., every hour) ensures data loss is limited to the snapshot interval.
The WGU Cloud Deployment and Operations Study Guide (Section 7.3, EBS and Snapshots) states,
"Automated EBS snapshots can be scheduled using CloudWatch Events rules to create backups at defined intervals, ensuring an RPO of one hour by capturing volume data regularly." Local storage, Cloud Control backups, and Block Express are not viable solutions for this automated snapshot requirement.
