Our company is a professional certificate exam materials provider, we have occupied in this field for years, and we have rich experiences. CCCS-203b exam cram is edited by professional experts, and they are quite familiar with the exam center, and therefore, the quality can be guaranteed. In addition, CCCS-203b training materials contain both questions and answers, and it also has certain quantity, and it's enough for you to pass the exam. In order to strengthen your confidence for CCCS-203b Training Materials , we are pass guarantee and money back guarantee, if you fail to pass the exam we will give you full refund, and no other questions will be asked.

CrowdStrike CCCS-203b Exam Syllabus Topics:

Topic	Details
Topic 1	Falcon Cloud Security Features and Services: This domain covers understanding CrowdStrike's cloud security products (CSPM, CWP, ASPM, DSPM, IaC security) and their integration, plus one-click sensor deployment and Kubernetes admission controller capabilities.
Topic 2	Findings and Detection Analysis: This domain covers evaluating security controls to identify IOMs, vulnerabilities, suspicious activity, and persistence mechanisms, auditing user permissions, comparing configurations to benchmarks, and discovering unmanaged public-facing assets.

Topic 3	• Cloud Security Policies and Rules: This domain addresses configuring CSPM policies, image assessment policies, Kubernetes admission controller policies, and runtime sensor policies based on specific use cases.

CCCS-203b exam questions: CrowdStrike Certified Cloud Specialist & CCCS-203b study materials

It is known to us that more and more companies start to pay high attention to the CCCS-203b certification of the candidates. Because these leaders of company have difficulty in having a deep understanding of these candidates, may it is the best and fast way for all leaders to choose the excellent workers for their company by the CCCS-203b certification that the candidates have gained. There is no doubt that the certification has become more and more important for a lot of people, especial these people who are looking for a good job, and it has been a general trend. More and more workers have to spend a lot of time on meeting the challenge of gaining the CCCS-203b Certification by sitting for an exam.

CrowdStrike Certified Cloud Specialist Sample Questions (Q296-Q301):

NEW QUESTION # 296

You want to deploy the Falcon sensor using 1-click sensor deployment when AWS Systems Manager is unavailable. Which IT automation software can you use to generate an inventory of unmanaged workloads?

- A. Jet
- B. Ansible
- C. Puppet
- D. Rudder

Answer: B

Explanation:

When AWS Systems Manager (SSM) is unavailable, Ansible is the supported and recommended IT automation tool for generating an inventory of unmanaged workloads and deploying the Falcon sensor using 1-click sensor deployment workflows.

CrowdStrike integrates with Ansible to enable discovery, inventory generation, and automated sensor installation across cloud and on-prem environments. Ansible's agentless architecture makes it especially suitable when native cloud management services are unavailable or restricted.

Other tools listed-Jet, Rudder, and Puppet-are not natively integrated with Falcon's 1-click deployment workflows for unmanaged workload discovery in cloud environments.

Therefore, Ansible is the correct answer.

NEW QUESTION # 297

Which of the following best describes the difference between managed and unmanaged items in the context of Falcon Cloud Security?

- A. Managed items are actively assessed for vulnerabilities, while unmanaged items are not assessed at all.
- B. Managed items refer to accounts or containers with CrowdStrike agents installed, while unmanaged items lack such direct control.
- C. Managed items are fully patched systems, while unmanaged items are systems that have pending updates.
- D. Managed items are those integrated into the Falcon platform, while unmanaged items are only monitored externally.

Answer: B

Explanation:

Option A: The terms managed and unmanaged do not directly relate to the patching status of systems. Both managed and unmanaged items could be fully patched or have pending updates.

Option B: Managed items refer to accounts or containers where CrowdStrike agents or direct integrations are applied, giving the Falcon platform control and visibility. Unmanaged items, by contrast, lack direct integration, meaning the platform can monitor them but not control them directly. This differentiation is critical for managing risks in hybrid environments.

Option C: Managed and unmanaged items are not defined by their vulnerability assessment status. Even unmanaged items can be assessed for risks through other tools or indirect integrations.

Option D: While managed items are integrated into the Falcon platform, unmanaged items are not merely "externally monitored." The key distinction lies in the presence or absence of direct CrowdStrike agent or integration.

NEW QUESTION # 298

While implementing a custom compliance framework within CrowdStrike, you must ensure the framework adapts to evolving regulatory requirements.

Which of the following actions best supports this goal?

- A. Rely solely on historical compliance audits for framework updates.
- **B. Incorporate automated regulatory change monitoring into the framework.**
- C. Delegate all regulatory updates to individual business units.
- D. Disable notifications for compliance-related updates in CrowdStrike.

Answer: B

Explanation:

Option A: While business units may provide input, centralizing updates ensures consistency and compliance across the organization. Decentralized updates increase the risk of gaps and inefficiencies.

Option B: Automated monitoring of regulatory changes ensures that the compliance framework remains current with evolving requirements. This approach reduces the risk of missing critical updates and facilitates proactive adjustments to maintain compliance. Automation streamlines the process and minimizes manual oversight, enabling the organization to respond swiftly to regulatory changes.

Option C: Disabling notifications can result in missed updates about changes to regulatory requirements or the CrowdStrike platform itself, jeopardizing compliance efforts. Notifications are vital for staying informed and proactive.

Option D: Historical audits provide valuable insights but do not account for new or upcoming regulatory changes. Solely relying on them can lead to outdated practices and non-compliance.

NEW QUESTION # 299

A security team is conducting an audit of user permissions in their cloud infrastructure monitored by CrowdStrike Falcon.

Which of the following findings would indicate a high-risk security posture that requires immediate action?

- A. A service account with limited permissions is used for an automated CI/CD pipeline.
- B. A developer has read-only access to a production environment for debugging purposes.
- **C. Multiple inactive user accounts retain administrator privileges and have not been used in several months.**
- D. An administrator rotates their access keys every 30 days as part of a security policy.

Answer: C

Explanation:

Option A: Frequent access key rotation improves security and aligns with best practices, reducing exposure to credential compromise.

Option B: Read-only access for developers in production is a controlled permission and does not present a high risk unless misused.

Option C: Service accounts with limited permissions are a best practice for automated processes and do not pose a significant security risk.

Option D: Inactive administrator accounts pose a major security risk because they could be compromised without detection. Attackers often target dormant accounts to escalate privileges and gain unauthorized access.

NEW QUESTION # 300

Which of the following best describes the primary function of CrowdStrike's Cloud Infrastructure Entitlement Manager (CIEM)/Identity Analyzer?

- A. Encrypting data stored in cloud object storage services.
- **B. Detecting excessive permissions and minimizing cloud identity risks.**
- C. Providing endpoint protection for virtual machines in the cloud.
- D. Monitoring network traffic for signs of unauthorized access.

Answer: B

Explanation:

Option A: Encryption is a data protection task handled by tools such as AWS KMS or Azure Key Vault, not CIEM.

Misinterpreting CIEM as a data encryption tool is a common misconception.

Option B: Endpoint protection is handled by solutions like CrowdStrike Falcon, not CIEM. CIEM focuses exclusively on identity and access management.

Option C: While important for cloud security, this is primarily the role of cloud network monitoring tools or firewalls, not CIEM, which focuses on identity and permissions.

Option D: CIEM/Identity Analyzer specializes in identifying excessive, unused, or misconfigured permissions across cloud environments, helping organizations enforce the principle of least privilege. This is critical for reducing the risk of insider threats and accidental exposures. Many users confuse this functionality with broader cloud security tools, but CIEM's focus is on identity and access governance.
