Just like the saying goes, it is good to learn at another man's cost. In the process of learning, it is more important for all people to have a good command of the method from other people. The Analytics-Arch-201 study materials from our company will help you find the good study method from other people. Using the Analytics-Arch-201 Study Materials from our company, you can not only pass your exam, but also you will have the chance to learn about the different and suitable study skills. We believe these skills will be very useful for you near life.

Do you worry about not having a long-term fixed study time? Do you worry about not having a reasonable plan for yourself? Analytics-Arch-201 exam dumps will solve this problem for you. Based on your situation, including the available time, your current level of knowledge, our study materials will develop appropriate plans and learning materials. You can use Analytics-Arch-201 test questions when you are available, to ensure the efficiency of each use, this will have a very good effect. You don't have to worry about yourself or anything else. Our study materials allow you to learn at any time. Regardless of your identity, what are the important things to do in Analytics-Arch-201 Exam Prep, when do you want to learn when to learn?

Analytics-Arch-201 Exam Learning | Analytics-Arch-201 Online Lab Simulation

The thousands of Channel Partner Program Analytics-Arch-201 certification exam candidates have passed their dream Salesforce Certified Tableau Architect Analytics-Arch-201 certification and they all used the valid and real Channel Partner Program Salesforce Certified Tableau Architect Analytics-Arch-201 Exam Questions. You can also trust Salesforce Certified Tableau Architect Analytics-Arch-201 pdf questions and practice tests.

Salesforce Analytics-Arch-201 Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none"> • Deploy Tableau Server: This domain assesses the ability of Tableau Administrators to perform production-ready deployments of Tableau Server. It encompasses installing and configuring Tableau Server with external components, supporting air-gapped environments, disaster recovery validations, and blue-green deployments. It includes configuring and troubleshooting various authentication methods such as SAML, Kerberos, and LDAP. The section also covers implementing encryption strategies, installing and verifying Tableau Server on Linux and Windows platforms, resolving installation and configuration issues, and managing service accounts and logging.
Topic 2	<ul style="list-style-type: none"> • Design a Tableau Infrastructure: This section of the exam measures skills of Tableau Consultants and focuses on planning and designing a complex Tableau deployment. It covers gathering user requirements, licensing strategies including Authorization-to-Run, high availability and disaster recovery planning, and mapping server add-ons to the organization's needs. It includes planning and implementing Tableau Cloud with Bridge, authentication, user provisioning, and multi-site configuration. Additionally, it addresses migration planning across Tableau products, operating systems, identity stores, and consolidations, as well as designing process topologies, sizing, node roles, and recommending server configurations including security, hardware, and disaster recovery.
Topic 3	<ul style="list-style-type: none"> • Monitor and Maintain a Tableau Deployment: This section evaluates skills of Tableau Administrators in monitoring, maintaining, and optimizing Tableau environments. It involves creating custom administrative dashboards, conducting load testing using tools like TabJolt, and analyzing test results. Troubleshooting complex performance bottlenecks in workbooks and server resources is key, as is tuning caching and scaling strategies. It covers leveraging observability tools such as the Resource Monitoring Tool, analyzing logs and metrics, and adjusting architecture accordingly. Automation of maintenance functions using APIs, scripting, and scheduling is included, along with managing server extensions, content automation, dashboard extensions, web data connectors, and secure embedded solutions.

Salesforce Certified Tableau Architect Sample Questions (Q168-Q173):

NEW QUESTION # 168

In the process of configuring OpenID Connect for Tableau Server, what is a critical step to ensure secure and efficient authentication?

- A. Disabling all other forms of authentication on Tableau Server to enforce OpenID Connect exclusively
- B. Setting up a direct database connection from Tableau Server to the OpenID Connect provider's database
- C. Configuring the Tableau Server to accept all OpenID Connect providers without validation
- **D. Registering Tableau Server as a client with the OpenID Connect provider and obtaining client credentials**

Answer: D

Explanation:

Registering Tableau Server as a client with the OpenID Connect provider and obtaining client credentials For secure and efficient authentication using OpenID Connect, it is essential to register the Tableau Server as a client with the OpenID Connect provider. This involves obtaining client credentials (client ID and client secret), which are used to authenticate requests from Tableau Server to the provider, ensuring secure communication and identity verification. Option A is incorrect because accepting all OpenID Connect providers without validation poses significant security risks. Option C is incorrect as setting up a direct database connection to the provider's database is not a standard or secure practice for configuring OpenID Connect. Option D is incorrect because disabling all other forms of authentication is not necessary and could limit flexibility and accessibility for users.

NEW QUESTION # 169

When building an administrative dashboard for monitoring server performance in Tableau, what key metric should be included to effectively track server health?

- A. The frequency of extract refreshes occurring on the server
- B. The number of published workbooks on the server
- C. The total number of users registered on the server

- **D. The average load time of views on the server**

Answer: D

Explanation:

The average load time of views on the server Including the metric of average load time of views on a Tableau Server administrative dashboard is crucial for effectively tracking server health. This metric provides insights into the server's performance and user experience, high-lighting potential issues or bottlenecks in view rendering that could affect overall server efficiency. Option A is incorrect because the number of published workbooks, while informative, does not directly indicate server health or performance. Option C is incorrect as the total number of registered users does not provide immediate insight into the current performance or health of the server. Option D is incorrect because the frequency of extract refreshes, while important for data freshness, does not directly reflect server performance in terms of view load times.

NEW QUESTION # 170

When configuring Azure Active Directory (AD) for authentication with Tableau Server, which of the following steps is essential for successful integration?

- A. Enabling multi-factor authentication for all users within Azure AD
- B. Configuring Tableau Server to synchronize with Azure AD at fixed time intervals
- C. Allocating additional storage on Tableau Server specifically for Azure AD user data
- **D. Registering Tableau Server as an application in Azure AD and configuring the necessary permissions**

Answer: D

Explanation:

Registering Tableau Server as an application in Azure AD and configuring the necessary permissions For successful integration of Tableau Server with Azure AD, it is crucial to register Tableau Server as an application within Azure AD. This registration process involves configuring the necessary permissions, which allows Tableau Server to authenticate users based on their Azure AD credentials securely. Option A is incorrect because while multi-factor authentication enhances security, it is not a requirement for the basic integration of Azure AD with Tableau Server. Option B is incorrect as fixed-time interval synchronization is not the primary step for integration; the focus is on configuring authentication protocols. Option D is incorrect because allocating additional storage for Azure AD user data on Tableau Server is not necessary for the integration process.

NEW QUESTION # 171

In the context of Tableau Server, what is an important consideration when configuring access to the Metadata API for external applications?

- A. Allowing unrestricted access to the Metadata API from any external application
- B. Ensuring external applications have direct database access for synchronized metadata retrieval
- C. Configuring the Metadata API to provide real-time updates to external applications
- **D. Implementing OAuth for secure, token-based authentication for external applications accessing the Metadata API**

Answer: D

Explanation:

Implementing OAuth for secure, token-based authentication for external applications accessing the Metadata API Implementing OAuth for secure, token-based authentication is crucial when allowing external applications to access the Metadata API. This ensures that only authorized applications can access the API, enhancing security by providing controlled access based on authenticated tokens. Option A is incorrect because unrestricted access can lead to security vulnerabilities and performance issues. Option B is incorrect as real-time updates are more related to the functionality of the Metadata API rather than its configuration for external applications. Option D is incorrect because direct database access is not a standard or safe practice for external applications, especially in the context of API access.

NEW QUESTION # 172

A large enterprise with high user concurrency and extensive data analysis needs is configuring its Tableau Server. What is the most appropriate process count configuration for this scenario?

- **A. Balancing the number of VizQL, Data Server, and Backgrounder processes to support user concurrency and data analysis**

needs

- B. Configuring a minimal number of backgrounders and VizQL processes to reduce server load
- C. Focusing solely on increasing the number of Backgrounder processes
- D. Maximizing the number of Data Server processes while minimizing other processes

Answer: A

Explanation:

Balancing the number of VizQL, Data Server, and Backgrounder processes to support user concurrency and data analysis needs A balanced configuration of VizQL, Data Server, and Backgrounder processes ensures efficient handling of high user concurrency and data processing demands, optimizing performance and responsiveness. Option A is incorrect because a minimal configuration could lead to performance bottlenecks due to high user demand. Option B is incorrect as focusing only on Data Server processes neglects the needs for visualization and back-ground tasks. Option D is incorrect because focusing solely on Backgrounder processes ignores the needs for user interaction and data querying.

NEW QUESTION # 173

.....

They work together and strive hard to design and maintain the top standard of Salesforce Analytics-Arch-201 exam questions. So you rest assured that the Analytics-Arch-201 exam questions you will not only ace your Salesforce Certified Tableau Architect certification exam preparation but also be ready to perform well in the final Analytics-Arch-201 Certification Exam. The Analytics-Arch-201 exam are the real Analytics-Arch-201 exam practice questions that will surely repeat in the upcoming Salesforce Certified Tableau Architect (Analytics-Arch-201) exam and you can easily pass the exam.
