實用的156-315.81最新考證和資格考試的領導者和高通過率156-315.81權威認證

即將參加CheckPoint的156-315.81認證考試的你沒有信心通過考試嗎？不用害怕，因為Testpdf可以提供給你最好的資料。Testpdf的156-315.81考古題是最新最全面的考試資料，一定可以給你通過考試的勇氣與自信。这是经过很多人证明过的事实。

最新的 Check Point Certified Security Expert 156-315.81 免費考試真題 (Q257-Q262):

問題 #257

You need to change the MAC-address on eth2 interface of the gateway. What is the correct way to change MAC-address in Check Point Gaia?

- A. In expert-mode run `ifconfig eth1 hw 11:11:11:11 11 11`
- **B. In CLISH run: `set interface eth2 mac-addr 11:11:11:11:11:11`**
- C. In expert-mode run: `ethtool -4 eth2 mac 11 11:11:11:11:11`
- D. In CLISH run `set interface eth2 hw-addr 11 11 11:11:11 11`

答案：B

解題說明：

The correct way to change MAC-address in Check Point Gaia is to run the command `set interface eth2 mac-addr 11:11:11:11:11:11` in CLISH mode. This command will change the MAC address of the eth2 interface to 11:11:11:11:11:11 and save the configuration. The other commands are either incorrect or not supported in Gaia. The `ifconfig` command is used in Expert mode to configure network interfaces, but it does not support changing MAC addresses. The `ethtool` command is used in Expert mode to query and control network device driver and hardware settings, but it does not support changing MAC addresses. The `set interface eth2 hw-addr` command is not a valid command in CLISH mode. Reference: [Changing MAC Address]

問題 #258

What is NOT a Cluster Mode?

- A. Load Sharing Unicast
- **B. Active-Active**
- C. Load Sharing Multicast
- D. High Availability Multicast

答案: B

解題說明:

Active-Active is not a cluster mode. Active-Active is a cluster configuration where both members are active and handle traffic simultaneously. However, this configuration is only supported for VSX clusters, not for regular clusters. The cluster modes for regular clusters are High Availability (HA), Load Sharing Unicast, and Load Sharing Multicast. Reference: [Check Point Security Expert R81 ClusterXL Administration Guide], page 7.

問題 #259

When performing a minimal effort upgrade, what will happen to the network traffic?

- A. All connections that were initiated before the upgrade will be handled by the standby gateway
- B. All connections that were initiated before the upgrade will be handled by the active gateway
- C. All connections that were initiated before the upgrade will be dropped, causing network downtime
- **D. All connections that were initiated before the upgrade will be handled normally**

答案: D

解題說明:

A minimal effort upgrade is a process of upgrading the Security Gateway software without changing the configuration or policy. It is done by using the CPUSE (Check Point Update Service Engine) tool, which is available in the Gaia Portal or CLI. The CPUSE tool performs a pre-upgrade verification to check the compatibility and readiness of the system for the upgrade. If the verification passes, the CPUSE tool installs the new software package and reboots the system. During the reboot, there is a short network downtime, but it does not affect the existing connections. All connections that were initiated before the upgrade will be handled normally by the upgraded gateway. The minimal effort upgrade preserves the existing configuration and policy, so there is no need to reinstall the policy or reconfigure the gateway after the upgrade.

Check Point Upgrade Path and Management Servers and Security Gateways Compatibility Maps, section "Minimal Effort Upgrade" INSTALLATION AND UPGRADE GUIDE R81, page 21-22

問題 #260

The Firewall Administrator is required to create 100 new host objects with different IP addresses. What API command can he use in the script to achieve the requirement?

- A. set hostname <New HostName> ip-address <ip address>
- **B. add host name <New HostName> ip-address <ip address>**
- C. add hostname <New HostName> ip-address <ip address>
- D. set host name <New HostName> ip-address <ip address>

答案: B

解題說明:

The API command add host name <New HostName> ip-address <ip address> can be used in a script to create 100 new host objects with different IP addresses. This command adds a new host object with the specified name and IP address to the database. The other commands are either not valid or not suitable for creating new host objects. Reference: Check Point - Management API reference

問題 #261

When Identity Awareness is enabled, which identity source(s) is(are) used for Application Control?

- A. Remote Access and RADIUS
- B. RADIUS
- **C. AD Query and Browser-based Authentication**
- D. AD Query

答案: C

解題說明:

When Identity Awareness is enabled, AD Query and Browser-based Authentication are used as identity sources for Application Control. AD Query allows the Security Gateway to query Active Directory servers for identity information based on IP addresses. Browser-based Authentication allows the Security Gateway to redirect unidentified users to a captive portal where they can authenticate with their credentials. These identity sources provide accurate and up-to-date identity information for Application Control, which can enforce granular policies based on user, group, machine, and domain objects. Reference: R81 Identity Awareness Administration Guide, page 9.
