WGU Scripting-and-Programming-Foundations certification exam opens the doors for starting a bright career in the sector. After

passing the WGU Scripting-and-Programming-Foundations test you will easily apply for good jobs in top companies all over the world. WGU Scripting-and-Programming-Foundations exam offers multiple advantages including, high salaries, promotions, enhancing resumes, and skills improvement. Once you pass the Scripting-and-Programming-Foundations Exam, you can avail all these benefits. If you want to pass the WGU Scripting-and-Programming-Foundations certification exam, you must find the best resource to prepare for the WGU Scripting-and-Programming-Foundations test.

WGU Scripting and Programming Foundations Exam Sample Questions (Q105-Q110):

NEW QUESTION # 105

A sample function is shown:

```
function F(integer x) returns
y = 4 * x - 8
```

What is returned for F (3)?

- A. 0
- B. 1
- **C. 2**
- D. 3

Answer: C

Explanation:

Let's evaluate F(3):

* $F(3) = (4 * 3) - 8$

* $F(3) = 12 - 8$

* $F(3) = 4$

NEW QUESTION # 106

It is given that integer x = 41 and integer y = 16. What is the value of the expression (x % y)?

- A. 0
- **B. 1**
- C. 2
- D. 3

Answer: B

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

The modulo operator (%) returns the remainder when the first operand is divided by the second. According to foundational programming principles (e.g., C and Python standards), for integers x and y, $x \% y$ computes the remainder of $x \div y$.

* Given: $x = 41$, $y = 16$.

* Compute: $41 \div 16 = 2$ (quotient, ignoring decimal) with a remainder.

* $16 \times 2 = 32$, and $41 - 32 = 9$. Thus, $41 \% 16 = 9$.

* Option A: "-15." This is incorrect. The modulo operation with positive integers yields a non-negative result.

* Option B: "-11." This is incorrect. The result is positive and based on the remainder.

* Option C: "-8." This is incorrect. The remainder cannot be negative here.

* Option D: "9." This is correct, as calculated above.

NEW QUESTION # 107

What is put to output by the following flowchart, if the input is 3.5?

- A. interviewBacking
- B. Backlog
- **C. Interview**
- D. Return

Answer: C

Explanation:

The flowchart provided in the image represents a decision-making process based on the input value. Given the input of 305, we follow the flowchart's decision paths. The first decision checks if the input is less than 200, which 305 is not, so we move to the next decision point. The second decision asks if the input is greater than 300. Since 305 is greater than 300, we follow the path for 'yes' which leads us to the output "Interview". Therefore, the correct output for the input 305 according to the flowchart is "Interview".

NEW QUESTION # 108

Which phase of a waterfall approach defines specifics on how to build a program?

- A. Testing
- B. Analysis
- **C. Design**
- D. Implementation

Answer: C

Explanation:

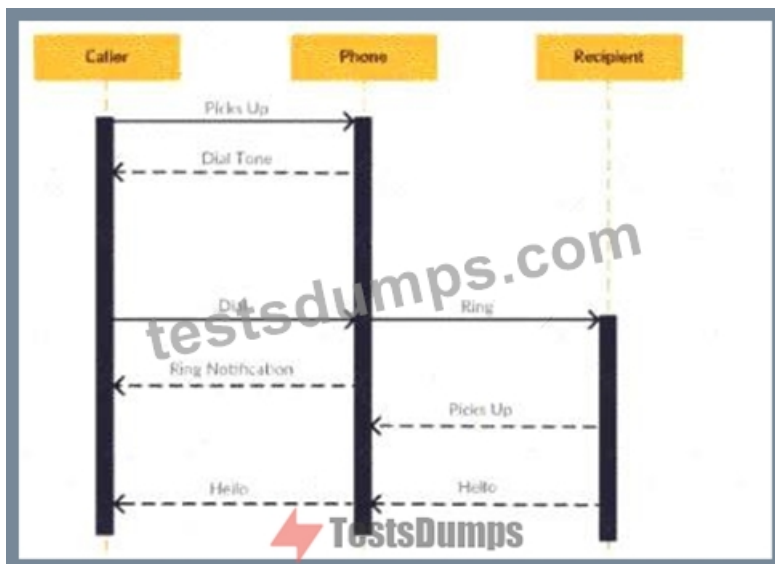

In the Waterfall approach to software development, the phase that defines and specifies how to build a program is the Design phase. This phase follows the initial Analysis phase, where the requirements are gathered, and precedes the Implementation phase, where the actual coding takes place. During the Design phase, the software's architecture, components, interfaces, and data are methodically planned out. This phase translates the requirements into a blueprint for constructing the software, ensuring that the final product will meet the specified needs.

References: The stages of the Waterfall methodology and their purposes are well-documented in project management and software engineering literature. Atlassian provides a comprehensive guide on the Waterfall methodology, detailing each phase and its significance¹. Built In also offers insights into the Waterfall methodology, including the systematic structure it provides for planning, organization, design, and testing².

These sources affirm the role of the Design phase in the Waterfall approach as the stage where the program's construction is defined.

NEW QUESTION # 109

Review the following sequence diagram:

What does a sequence diagram do?

- A. Shows interactions and indicates an order of events
- B. Shows interactions but does not specify an order of events
- C. Shows an order of events but does not specify all interactions
- D. Shows static elements of software

Answer: A

Explanation:

A sequence diagram is a type of interaction diagram used in software engineering to model the interactions between objects within a system over time. It shows how objects interact with each other and the order in which those interactions occur. The sequence diagram is organized along two dimensions: horizontally to represent the objects involved, and vertically to represent the time sequence of interactions. This allows the diagram to depict not only the interactions but also the sequence of events as they occur over time.

Option B is incorrect because a sequence diagram does indeed specify an order of events. Option C is incorrect as sequence diagrams do not show static elements of software but rather the dynamic interactions.

Option D is also incorrect because a sequence diagram does show all interactions along with their order.
