## SCS-C03學習指南，SCS-C03考試證照

患難可以試驗一個人的品格，非常的境遇方才可以顯出非常的氣節；風平浪靜的海面，所有的船隻都可以並驅競勝。命運的鐵拳擊中要害的時候，只有大勇大智的人才能夠處之泰然。你是大智大勇的人嗎？如果你的IT認證考試沒有做好考前準備，你還處之泰然嗎？當然，因為你有 Fast2test Amazon的SCS-C03考試培訓資料在手上，任何考試困難都不會將你打到。

### Amazon SCS-C03 考試大綱：

| 主題   | 簡介   |
|------|--|
| 主題 1 | <ul style="list-style-type: none"> <li>Security Foundations and Governance: This domain addresses foundational security practices including policies, compliance frameworks, risk management, security automation, and audit procedures for AWS environments.</li> </ul> |
| 主題 2 | <ul style="list-style-type: none"> <li>Identity and Access Management: This domain deals with controlling authentication and authorization through user identity management, role-based access, federation, and implementing least privilege principles.</li> </ul>      |
| 主題 3 | <ul style="list-style-type: none"> <li>Data Protection: This domain centers on protecting data at rest and in transit through encryption, key management, data classification, secure storage, and backup mechanisms.</li> </ul>   |
| 主題 4 | <ul style="list-style-type: none"> <li>Detection: This domain covers identifying and monitoring security events, threats, and vulnerabilities in AWS through logging, monitoring, and alerting mechanisms to detect anomalies and unauthorized access.</li> </ul>        |

- Incident Response: This domain addresses responding to security incidents through automated and manual strategies, containment, forensic analysis, and recovery procedures to minimize impact and restore operations.

## 最新的 AWS Certified Specialty SCS-C03 免費考試真題 (Q86-Q91):

### 問題 #86

A company needs the ability to identify the root cause of security findings in an AWS account. The company has enabled VPC Flow Logs, Amazon GuardDuty, and AWS CloudTrail. The company must investigate any IAM roles that are involved in the security findings and must visualize the findings.

Which solution will meet these requirements?

- A. Use Amazon Inspector to run investigations on the IAM roles and visualize the findings.
- B. Export GuardDuty findings to Amazon S3 and analyze them with Amazon Athena.
- **C. Use Amazon Detective to run investigations on the IAM roles and to visualize the findings.**
- D. Enable AWS Security Hub and use custom actions to investigate IAM roles.

答案: C

解題說明:

Amazon Detective is a managed service designed specifically to investigate and analyze security findings by automatically correlating data from Amazon GuardDuty, AWS CloudTrail, and VPC Flow Logs. According to the AWS Certified Security - Specialty Official Study Guide, Detective enables security teams to identify root causes, anomalous behavior, and indicators of compromise through interactive visualizations.

Amazon Detective allows investigators to pivot directly to IAM roles, users, and resources that are involved in GuardDuty findings. Detective builds behavior graphs and timelines that show API activity, network traffic, and historical context, making it easier to understand how and why a security incident occurred.

Amazon Inspector (Option B) focuses on vulnerability scanning of compute resources and does not investigate IAM behavior.

Option C requires manual analysis and lacks native visualization. AWS Security Hub (Option D) aggregates findings but does not perform root-cause investigation or behavioral analysis.

AWS documentation explicitly states that Amazon Detective is the recommended service for deep-dive investigations following GuardDuty alerts, especially when IAM roles are involved.

\* Amazon Detective User Guide

\* Amazon GuardDuty Integration Documentation

### 問題 #87

A company is developing an application that runs across a combination of Amazon EC2 On-Demand Instances and Spot Instances. A security engineer needs to provide a logging solution that makes logs for all instances available from a single location. The solution must allow only a specific set of users to analyze the logs for event patterns. The users must be able to use SQL queries on the logs to perform root cause analysis.

Which solution will meet these requirements?

- A. Configure the EC2 instances to send application logs to a single Amazon S3 bucket. Allow only specific users to access the S3 bucket. Use Amazon CloudWatch Logs Insights to query the log files in the S3 bucket.
- B. Configure the EC2 instances to send application logs to a single Amazon CloudWatch Logs log group. Grant Amazon Detective access to the log group. Allow only specific users to use Detective to analyze the logs.
- **C. Configure the EC2 instances to send application logs to a single Amazon CloudWatch Logs log group. Allow only specific users to access the log group. Use CloudWatch Logs Insights to query the log group.**
- D. Configure each EC2 instance to send its application logs to its own specific Amazon CloudWatch Logs log group. Allow only specific users to access the log groups. Use Amazon Athena to query all the log groups.

答案: C

解題說明:

Amazon CloudWatch Logs provides a centralized, scalable service for collecting and storing logs from Amazon EC2 instances, regardless of whether the instances are On-Demand or Spot Instances. According to the AWS Certified Security - Specialty Official Study Guide, CloudWatch Logs is the recommended service for centralized log aggregation and near-real-time analysis of application

and system logs.

By configuring all EC2 instances to send logs to a single CloudWatch Logs log group, the security engineer ensures that logs from all instances are available in one centralized location. Access to the log group can be restricted by using IAM policies, ensuring that only authorized users can view and analyze the logs.

CloudWatch Logs Insights provides a powerful query language with SQL-like syntax, enabling users to search, filter, aggregate, and analyze log data efficiently. This directly satisfies the requirement for SQL-style queries to identify event patterns and perform root cause analysis without requiring data movement or additional services.

Option B is incorrect because CloudWatch Logs Insights cannot query log files stored in Amazon S3. Option C is inefficient and operationally complex, as Athena cannot directly query CloudWatch Logs log groups.

Option D is invalid because Amazon Detective is designed for security investigations using GuardDuty findings, not for general application log analysis.

AWS documentation explicitly states that CloudWatch Logs combined with CloudWatch Logs Insights is the most efficient and secure approach for centralized log analysis in EC2-based architectures.

### 問題 #88

A company's security team wants to receive near-real-time email notifications about AWS abuse reports related to DoS attacks. An Amazon SNS topic already exists and is subscribed to by the security team. What should the security engineer do next?

- A. Poll Trusted Advisor for abuse notifications by using a Lambda function.
- B. Detect abuse reports by using CloudTrail logs and CloudWatch alarms.
- **C. Create an Amazon EventBridge rule that matches AWS Health events for AWS\_ABUSE\_DOS\_REPORT and publishes to SNS.**
- D. Poll the AWS Support API for abuse cases by using a Lambda function.

答案： C

解題說明：

AWS abuse notifications are delivered as AWS Health events. According to the AWS Certified Security - Specialty Study Guide, Amazon EventBridge integrates natively with AWS Health and can be used to detect specific event types such as AWS\_ABUSE\_DOS\_REPORT in near real time.

By creating an EventBridge rule that filters for the abuse report event type and publishes directly to Amazon SNS, the solution remains fully managed, low latency, and cost effective.

Polling APIs introduces delay and complexity. CloudTrail does not log abuse notifications.

EventBridge with AWS Health is the recommended mechanism for reacting to AWS service events.

### 問題 #89

A company hosts its public website on Amazon EC2 instances behind an Application Load Balancer (ALB). The website is experiencing a global DDoS attack from a specific IoT device brand that uses a unique user agent. A security engineer is creating an AWS WAF web ACL and will associate it with the ALB. Which rule statement will mitigate the current attack and future attacks from these IoT devices without blocking legitimate customers?

- A. Use a geographic match rule statement.
- **B. Use a string match rule statement on the user agent.**
- C. Use a rate-based rule statement.
- D. Use an IP set match rule statement.

答案： B

解題說明：

AWS WAF string match rule statements allow inspection of HTTP headers, including the User-Agent header. According to AWS Certified Security - Specialty guidance, when malicious traffic can be uniquely identified by a consistent request attribute, such as a device-specific user agent, a string match rule provides precise mitigation with minimal false positives.

IP-based blocking is ineffective for globally distributed botnets. Geographic blocking risks denying access to legitimate users. Rate-based rules limit request volume but do not prevent low-and-slow attacks.

By matching the unique IoT device brand in the User-Agent header, the security engineer can block only malicious requests while preserving customer access.

## 問題 #90

A company in France uses Amazon Cognito with the Cognito Hosted UI as an identity broker for sign-in and sign-up processes. The company is marketing an application and expects that all the application's users will come from France. When the company launches the application, the company's security team observes fraudulent sign-ups for the application. Most of the fraudulent registrations are from users outside of France.

The security team needs a solution to perform custom validation at sign-up. Based on the results of the validation, the solution must accept or deny the registration request.

Which combination of steps will meet these requirements? (Select TWO.)

- A. Use Amazon Cognito to configure a social identity provider (IdP) to validate the requests on the hosted UI.
- B. Use a geographic match rule statement to configure an AWS WAF web ACL. Associate the web ACL with the Amazon Cognito user pool.
- C. Update the application's Amazon Cognito user pool to configure a geographic restriction setting.
- D. Create a pre sign-up AWS Lambda trigger. Associate the Amazon Cognito function with the Amazon Cognito user pool.
- E. Configure an app client for the application's Amazon Cognito user pool. Use the app client ID to validate the requests in the hosted UI.

答案： B,D

解題說明：

To perform custom validation at sign-up and explicitly accept or deny registrations, Amazon Cognito provides Lambda triggers. A pre sign-up trigger runs synchronously during the sign-up flow (including the Hosted UI) and can implement custom checks (for example, IP reputation checks, email/domain validation, velocity checks, allow/deny lists, or geo checks using an external service). Based on the trigger logic, the function can allow the sign-up to proceed or reject it, meeting the "custom validation" and "accept/deny" requirement directly.

Because the observed fraud largely originates outside France, adding a front-door geographic control reduces unwanted traffic before it reaches Cognito. AWS WAF supports Geo match conditions in a web ACL to allow

/deny requests by country, which is a common mitigation for region-scoped applications. Associating a WAF web ACL to protect the Hosted UI endpoint helps block sign-up requests from non-French locations early, reducing fraud attempts and load.

The other options do not meet the requirement: Cognito user pools do not provide a native "geographic restriction setting" for sign-up (D), app client ID validation does not stop fraudulent sign-ups (C), and using a social IdP does not provide custom accept/deny validation for all sign-ups (E).

## 問題 #91

.....

想要通過SCS-C03認證考試並不是僅僅依靠與考試相關的書籍就可以辦到的。與其盲目地學習考試要求的相關知識，不如做一些有價值的試題。一本高效率的考古題是大家準備考試時必不可少的工具。所以，快點購買Fast2test的SCS-C03考古題吧。這是一本命中率很高的考古題，比其他任何學習方法都有效。這是可以保證你一次就成功的難得的資料。
