## Cloud Security Alliance Certificate of Cloud Security Knowledge v5 (CCSKv5.0) Sample Questions (Q331-Q336):

### NEW QUESTION # 331

Which resilience tool helps distribute network or application traffic across multiple servers to ensure reliability and availability?

- A. Auto-scaling
- B. Failover
- **C. Load balancing**
- D. Redundancy

**Answer: C**

Explanation:

Load balancing is a key resilience strategy in both traditional and cloud environments. It evenly distributes network or application traffic across multiple servers to ensure no single server becomes a point of failure or overloaded, thereby improving system availability, performance, and fault tolerance.

In cloud infrastructure, load balancers may work at various OSI layers (Layer 4 or Layer 7) and are often integrated into cloud platforms as managed services (e.g., AWS Elastic Load Balancer or Azure Load Balancer). They play a critical role in mitigating risks like traffic spikes, system failure, or regional outages.

This technique is described in Domain 7: Infrastructure Security of the CCSK guidance, which highlights tools like load balancing, redundant systems, and failover mechanisms to support cloud resilience and availability.

### NEW QUESTION # 332

What are the key outcomes of implementing robust cloud risk management practices?

- A. Reducing the need for compliance with regulatory requirements
- B. Transferring compliance to the cloud service provider via inheritance
- **C. Ensuring the security and resilience of cloud environments**
- D. Negotiating shared responsibilities

**Answer: C**

Explanation:

The key outcomes of implementing robust cloud risk management practices focus on ensuring the security and resilience of cloud environments. This involves identifying, assessing, and mitigating risks associated with the use of cloud services, such as security threats, data privacy issues, and service availability concerns.

By adopting strong risk management practices, organizations can better protect their data, ensure business continuity, and maintain compliance with regulations, which ultimately strengthens the overall security and reliability of their cloud environments.

Negotiating shared responsibilities is an important aspect of cloud security but is not the direct outcome of risk management practices. It's about clarifying roles between the customer and provider. Transferring compliance to the cloud service provider via inheritance is not the complete picture. While cloud service providers may help with compliance, the responsibility for compliance and risk management is still shared.

Reducing the need for compliance with regulatory requirements is incorrect. Robust risk management practices help ensure compliance with regulatory requirements, not reduce the need for them.

### NEW QUESTION # 333

What tool allows teams to easily locate and integrate with approved cloud services?

- A. Contracts
- B. Risk Register
- C. Shared Responsibility Model
- **D. Service Registry**

**Answer: D**

Explanation:

A Service Registry lists approved services, making it easy for teams to find and integrate compliant services.

### NEW QUESTION # 334

Term which defined acquired IT Technologies without the knowledge of IT Department is:

- A. Shadow IT
- B. Shadow servers
- C. Shadow devices
- D. Shadow application

**Answer: A**

Explanation:

Shadow IT is a term often used to describe information-technology systems and solutions built and used inside organizations without explicit organizational approval.

#### NEW QUESTION # 335

What is the process to determine any weaknesses in the application and the potential ingress, egress, and actors involved before the weakness is introduced to production?

- A. Vulnerability Assessment
- B. Threat Modelling
- C. Threat Detection
- D. STRIDE

**Answer: B**

Explanation:

Threat modelling is performed once an application design is created. The goal of threat modelling is to determine any weaknesses in the application and the potential ingress, egress, and actors involved before the weakness is introduced to production. It is the overall attack surface that is amplified by the cloud, and the threat model has to take that into account.
