

Efficient Integration-Architect Sample Questions Pdf & Leading Provider in Qualification Exams & Free Download Integration-Architect Exam Quizzes

BONUS!!! Download part of Test4Cram Integration-Architect dumps for free: <https://drive.google.com/open?id=1c68fbMzTyFJI1xeZDaLfHHIsS1cSkV9X>

With the company of our Integration-Architect study dumps, you will find the direction of success. There is nothing more exciting than an effective and useful Integration-Architect question bank to study with for your coming exam. The sooner you use Integration-Architect Training Materials, the more chance you will pass the Integration-Architect exam, and the earlier you get your certificate. You definitely have to have a try and you will be satisfied without doubt.

Salesforce Integration-Architect Certification is a valuable credential for professionals who want to demonstrate their expertise in Salesforce integration. It is a challenging certification exam that requires a deep understanding of integration patterns, technologies, and best practices. Salesforce Certified Integration Architect certification is ideal for professionals who want to advance their careers in Salesforce integration and assume leadership roles in integration projects.

Integration-Architect Exam Quizzes & Integration-Architect Valid Exam Format

Our Integration-Architect PDF format is also an effective format to do test preparation. In your spare time, you can easily use the Integration-Architect dumps PDF file for study or revision. The PDF file of Salesforce Integration-Architect real questions is convenient and manageable. These Salesforce Integration-Architect Questions are also printable, giving you the option of paper study since some Salesforce Integration-Architect applicants prefer off-screen preparation rather than on a screen.

Salesforce Certified Integration Architect Sample Questions (Q41-Q46):

NEW QUESTION # 41

A developer has been tasked by the integration architect to build a solution based on the Streaming API. The developer has done some research and has found there are different implementations of the events in Salesforce (PushTopic Events, Change Data Capture, Generic Streaming, Platform Events), but is unsure of how to proceed with the implementation and asks the system architect for some guidance.

What should the architect consider when making the recommendation?

- A. Change Data Capture can be published from Apex.
- **B. Change Data Capture does not have record access support.**
- C. PushTopic Events can define a custom payload.

Answer: B

NEW QUESTION # 42

Only authorized users are allowed access to the EBS and the Enterprise DMS.

Customers call Customer Support when they need clarification on their bills. Customer Support needs seamless access to customer billing information from the E and view generated bills from the DMS.

Which three authorization and authentication needs should an integration consultant consider while integrating the DMS and ESB with Salesforce?

should an integration consultant consider while integrating the DMS and ESB with Salesforce?

Choose 3 answers

- A. Users should be authenticated into DMS and EBS without having to enter username and password.
- B. Consider Enterprise security needs for access to DMS and EBS.
- C. Consider options to migrate DMS and EBS into Salesforce.
- D. Identify options to maintain DMS and EBS authentication and authorization details in Salesforce.
- E. Users should be authorized to view information specific to the customer they are servicing without a need to search for customer.

Answer: A,B,E

Explanation:

Explanation

The integration consultant should consider the following authorization and authentication needs while integrating the DMS and ESB with Salesforce:

Users should be authorized to view information specific to the customer they are servicing without a need to search for customer.

This means that the integration should provide a seamless and contextual access to the customer billing information and generated bills from the DMS and ESB, based on the customer record or case that the user is working on in Salesforce.

Consider Enterprise security needs for access to DMS and ESB. This means that the integration should comply with the security policies and standards of the Enterprise, such as encryption, auditing, logging, monitoring, etc.

Users should be authenticated into DMS and ESB without having to enter username and password. This means that the integration should use a single sign-on (SSO) mechanism that allows users to access multiple systems with one login credential, such as OAuth or SAML34 References: Authorization Through Connected Apps and OAuth 2.0, Single Sign-On for Desktop and Mobile Applications using SAML and OAuth

NEW QUESTION # 43

A customer of Salesforce has used Platform Events to integrate their Salesforce instance with an external third-party Artificial Intelligence (AI) system. The AI system provides a prediction score for each lead that is received by Salesforce. Once the prediction score is received, the lead information is saved to Platform events for other processes. The trigger on the Platform Events is failing once this was rolled out to Production.

What type of monitoring should the Integration Consultant have considered to monitor this integration?

- A. Set up debug logs for Platform Event triggers to monitor performance.
- B. Monitor the volume of leads that are created in Salesforce.
- C. Monitor Platform Events created per hour limits across the Salesforce instance.
- D. Validate the Platform Event definition matches leads definition.

Answer: C

NEW QUESTION # 44

Northern Trail Outfitters (NTO) uses Salesforce to track leads, opportunities, and order details that convert leads to customers.

However, orders are managed by an external (remote) system. Sales reps want to view and update real-time order information in Salesforce. NTO wants the data to only persist in the external system.

Which type of integration should an architect recommend to meet this business requirement?

- A. Process Orchestration
- B. Data Virtualization
- C. Data Synchronization

Answer: B

Explanation:

The requirement to view and update data in real-time while ensuring the data only persists in the external system is the definition of a Data Virtualization pattern. In this architectural model, Salesforce does not store a local copy of the data (which would be Data Synchronization), but instead acts as a window into the external system of record.

An Integration Architect implements Data Virtualization primarily through Salesforce Connect. This tool allows the external system's order table to be represented as an External Object in Salesforce. Because the data is retrieved on-demand via a web service call (typically using the OData protocol), it is always "real-time." Furthermore, since Salesforce Connect supports writeable external objects, sales reps can update the order information directly from the Salesforce UI, and those changes are sent back to the external system immediately without being saved to the Salesforce database.

This approach is superior to Data Synchronization (Option A) in this specific use case because it eliminates the need for data storage costs and the complexity of keeping two databases in sync. It is also distinct from Process Orchestration (Option C), which focuses on the sequencing of tasks across multiple systems rather than the real-time presentation of external data. By utilizing Data Virtualization, NTO achieves a seamless user experience where external orders look and feel like native Salesforce records while strictly adhering to the "no persistence" constraint.

NEW QUESTION # 45

An Integration Architect has built a solution using REST API, updating Account, Contact, and other related information. The data volumes have increased, resulting in higher API calls consumed, and some days the limits are exceeded. A decision was made to decrease the number of API calls using bulk updates. The customer prefers to continue using REST API to avoid architecture changes.

Which REST API composite resources should the Integration Architect use to allow up to 200 records in one API call?

- A. Composite
- **B. SObject Collections**
- C. Batch
- D. SObject Tree

Answer: B

Explanation:

Explanation

SObject Collections is a REST API composite resource that allows you to create, update, or delete up to 200 records in one API call. You can specify the type of operation (create, update, or delete) for each record in the request body, and the response body will contain the status and IDs of each record. SObject Collections is suitable for bulk operations on records that are not related to each other¹.

SObject Tree is another REST API composite resource that allows you to create up to 200 records in one API call. However, unlike SObject Collections, SObject Tree requires the records to be related to each other in a hierarchy. You can specify the parent and child records in a JSON tree structure, and the response body will contain the reference IDs and URLs of each record. SObject Tree is suitable for creating nested data in one request².

Batch is a REST API composite resource that allows you to combine up to 25 requests in one API call. Each request can be a different type of operation (query, create, update, delete, etc.) on different objects. The response body will contain the status and results of each request. Batch is suitable for grouping multiple requests into one transaction³.

Composite is a REST API composite resource that allows you to execute a series of REST API requests in one API call. You can use the output of one request as the input of another request using a reference ID. The response body will contain the status and results of each request. Composite is suitable for chaining requests that depend on each other.

Therefore, the correct answer is A, because SObject Collections is the only REST API composite resource that allows bulk updates on records that are not related to each other.

NEW QUESTION # 46

.....

We strongly advise you to buy our online engine and windows software of the Integration-Architect study materials, which can simulate the real test environment. There is no doubt that you will never feel bored on learning our Integration-Architect practice materials because of the smooth operation. You will find that learning is becoming interesting and easy. And you will be more confident to pass the exam since that you have experience the Real Integration-Architect Exam.
