Salesforce Order Management Administrator Accredited Professional Sample Questions (Q66-Q71):

NEW QUESTION # 66

What are two ways an administrator can query Order Summaries using APIs in Workbench?

- A. Connect API
- B. Composite API
- C. Platform API
- D. Apex API
- E. Invocable API

Answer: B,C

Explanation:

Two ways that an administrator can query Order Summaries using APIs in Workbench are:

Platform API. The Platform API is a set of REST and SOAP APIs that allow developers to access data and functionality in Salesforce from external systems. The Platform API includes various resources and operations for querying, creating, updating, or

deleting records in Salesforce, such as Order Summaries. The administrator can use the Platform API in Workbench by selecting the REST Explorer or SOAP Explorer tabs, and entering the appropriate request URL and parameters.

Composite API. The Composite API is a type of REST API that allows developers to execute multiple subrequests in a single HTTP request. The Composite API includes various resources and operations for batching, tree, sObject collections, or transactions in Salesforce, such as Order Summaries. The administrator can use the Composite API in Workbench by selecting the REST Explorer tab, and entering the appropriate request URL and JSON body.

NEW QUESTION # 67

An admin is working with Order Management licensed as standalone (B2C Commerce is not in the scenario).

The admin submits a JSON payload using Workbench and Workbench indicates the operation was successful. The second time the same payload is submitted the operation fails. What are two likely causes?

- A. The Order Reference Number must be updated
- B. The payment data must be updated
- C. Stock Keeping Unit values must be updated
- D. The stock levels in the org are depleted from the first order

Answer: A,B

Explanation:

Two likely causes that could make the second submission of the same JSON payload fail are:

The payment data must be updated. The payment data in the JSON payload contains information such as the payment method, amount, and authorization code. If the same payment data is used for the second order, it may cause a duplicate payment error or an invalid authorization error.

The Order Reference Number must be updated. The Order Reference Number is a unique identifier for each order that is generated by the external system and sent in the JSON payload. If the same Order Reference Number is used for the second order, it may cause a duplicate order error or an invalid order error.

NEW QUESTION # 68

A customer wants to change the layout of the out of the box Order Summary Lightning Record Page to three columns instead of two. How can an administrator satisfy this requirement?

- A. Edit the Lightning Record Page and change the Template to Three Regions
- B. Add another column component to the existing Lightning Record Page
- C. Create a new Lightning Record Page and select the Three Regions template
- D. Change the page layout template to Three Regions in the layout editor

Answer: A

Explanation:

The best way for the administrator to satisfy this requirement is to edit the Lightning Record Page and change the Template to Three Regions. A Lightning Record Page is a type of page that displays details and related information about a specific record in Lightning Experience or Salesforce mobile app. A Lightning Record Page can be customized using the Lightning App Builder, which is a tool that allows administrators to drag and drop components onto a page layout. A Template is a predefined layout that determines how components are arranged on a page. A Three Regions template is a type of template that divides the page into three columns or regions. The administrator can edit the Lightning Record Page for the Order Summary object, and change the Template to Three Regions in the Lightning App Builder. NEW QUESTION # 69

An administrator has created a new currency field on the Fulfillment Order object and wants to roll up the total to the Order Summary object. When creating a rollup field on the Order Summary object, Fulfillment Order does not appear as an option. Why

is this?

- A. Rollup Fields cannot sum Currency Fields
- **B. The Order Summary field on the Fulfillment Order object is a Lookup**
- C. The Order Summary object has reached the limit of Rollup Summary fields
- D. The Rollup Summary field must be created on the Fulfillment Order object with the Order Summary object as the parent

Answer: B

Explanation:

Explanation

The reason why Fulfillment Order does not appear as an option when creating a rollup field on the Order Summary object is that the Order Summary field on the Fulfillment Order object is a Lookup. A Lookup field is a type of custom field that creates a relationship between two objects, but does not support rollup summary fields. To create a rollup summary field, the relationship between the objects must be master-detail, which means that the child record cannot exist without its parent record. NEW QUESTION # 70

A user is encountering an error when attempting to save an Account record. What can an administrator use to research the issue?

- A. The Problems tab within the developer console
- B. The Chrome Dev Tools Console
- C. Lightning Logs within Setup
- **D. A user trace flag and debug log on the affected user**

Answer: D

Explanation:

The best way for an administrator to research the issue when a user is encountering an error when attempting to save an Account record is to use a user trace flag and debug log on the affected user. A user trace flag enables debug logging for a specific user, and a debug log captures database operations, system processes, and errors that occur when executing a transaction or running unit tests. The administrator can use these tools to identify the root cause of the error and fix it accordingly. Verified References:
